SECURITY CLASSIFICATION OF THIS PAGE (When Data Entered)

This volume presents a record of large-scale solar magnetic fields and solar activity during 130 solar rotations, from November 1964 through July 1974, in the form of H-alpha synoptic charts and accompanying descriptive notes. A new perspective on large-scale magnetic fields is provided by the inference of lines of polarity reversal from the systems of structures visible in H-alpha patrol filtergrams. These structures map the neutral lines in the radial component of solar magnetic fields [McIntosh, 1972a], thereby revealing details of the boundaries to large-scale magnetic fields that are not recorded in magnetograms sensitive to the longitudinal (line-of-sight) component of the fields.

This atlas testifies that neutral lines are of themselves important physical features in solar activity. They are associated directly with systems of physical structures. They form continuous lines that often encircle the entire sun. They have lifetimes in excess of 2 years. The neutral-line patterns normally predate, and survive, the occurrence of important centers of sunspot and flare activity.

The period of observations included in this atlas begins with solar minimum at the start of Solar Cycle 20 and continues to within 2 years of the next solar minimum. Charts for the first year of the solar cycle were constructed for study of Mariner 4 interplanetary observations [Nolte, 1974; McIntosh and Nolte, 1975; Nolte and Roelof, 1977], but the first charts to appear in a final, edited form were those for rotations 1523-1525 [Roelof and Krimigis, 1973]. The last chart in the atlas coincides with the commencement of regular publication of edited preliminary synoptic charts in *Solar-Geophysical Data*.

*Pisces solis.* The pattern of solar magnetic fields facing earth on 21 July 1973, as mapped from structures observed with an H-alpha half-angstrom filter.

# PREFACE

The procedures for inferring solar magnetic fields from H-alpha observations were developed as an aid to the real-time solar flare predictions issued by the Space Environment Laboratory's Space Environment Services Center [McIntosh, 1969, 1970a, 1972a]. Daily use of these procedures for analysis of solar active regions gradually showed that the large-scale magnetic fields were also discernible in the H-alpha structures. Early papers on interplanetary magnetic sector structure were appearing in 1969 at the time the first provisional H-alpha synoptic charts were made. These inspired a search for the solar source of sector structure among the giant patterns of neutral lines [McIntosh, 1970b, 1972b]. Although preliminary studies were encouraging, they also indicated that any useful study required data on large-scale magnetic patterns for an entire solar cycle. Likewise, the early observations of dynamics and cellular organization of these patterns raised significant questions that could be answered only with a much larger data base.

I presented one of the first H-alpha synoptic charts before the Asilomar Solar Wind Conference in early 1971 and suggested that the large-scale neutral-line patterns represented the organization of the overlying large-scale coronal magnetic fields [McIntosh, 1972b]. In the audience was E.C. Roelof, who immediately recognized the value of the H-alpha synoptic charts to his unique attempts at tracing interplanetary energetic particle populations, interplanetary field polarity patterns, and solar wind streams back to their solar sources. The following year the first complete H-alpha synoptic charts, rotations 1523-1525, were constructed specifically for a period of satellite observations under investigation by Drs. E.C. Roelof and S.M. Krimigis. Little did we realize that a 7-year effort was beginning that would ultimately involve more than a dozen persons and yield an H-alpha atlas of Solar Cycle 20. The early excitement generated by the suspected association of interplanetary parameters with the global solar magnetic field was greatly heightened by the confirmation of these associations that this first set of H-alpha synoptic charts provided. The associations were shown to be borne out not only in the interplanetary medium [Roelof and Krimigis, 1973; McIntosh and Roelof, 1972; Nolte and Roelof, 1977], but also in the coronal X-ray images obtained from Skylab [McIntosh et al., 1976].

The initial successful correlations, the vision and energy shown by Dr. Roelof, and the excellent work of his colleagues at the Applied Physics Laboratory led to the decision to attempt the construction of an annotated atlas of H-alpha synoptic charts for Solar Cycle 20. Institutional support for this undertaking came from The Johns Hopkins University, the National Oceanic and Atmospheric Administration and the University of New Hampshire. Support for the cartographers was provided via a contract to and administered by Dr. E.C. Roelof from the Air Force Geophysical Laboratory (formerly the Air Force Cambridge Research Laboratories).

Many exceptional, gifted, and dedicated people worked hard to produce this volume. I have attempted to give credit in the Acknowledgments to all. Of this group, however, three were so outstanding in their contributions that I wish to acknowledge them in the Preface. These are Mrs. Susan C. Wayland, Mrs. Janice E. Leighton, and Miss Sharon L. Osborne. Not only did they produce nearly half of the 130 charts in the atlas, but they also aided in the development and codification of mapping techniques, maintained project organization, provided training for other cartographers, wrote progress reports, and produced some of the "real-time" synoptic charts for use by the NOAA Space Environment Laboratory's Space Environment Services Center. Their role was essential, and it has been a privilege for me to have worked with them in the production of this atlas.

## Introduction

This volume presents a record of large-scale solar magnetic fields and solar activity during 130 solar rotations, from November 1964 through July 1974, in the form of H-alpha synoptic charts and accompanying descriptive notes. A new perspective on large-scale magnetic fields is provided by the inference of lines of polarity reversal from the systems of structures visible in H-alpha patrol filtergrams. These structures map the neutral lines in the radial component of solar magnetic fields [McIntosh, 1972a], thereby revealing details of the boundaries to large-scale magnetic fields that are not recorded in magnetograms sensitive to the longitudinal (line-of-sight) component of the fields.

This atlas testifies that neutral lines are of themselves important physical features in solar activity. They are associated directly with systems of physical structures. They form continuous lines that often encircle the entire sun. They have lifetimes in excess of 2 years. The neutral-line patterns normally predate, and survive, the occurrence of important centers of sunspot and flare activity.

The period of observations included in this atlas begins with solar minimum at the start of Solar Cycle 20 and continues to within 2 years of the next solar minimum. Charts for the first year of the solar cycle were constructed for study of Mariner 4 interplanetary observations [Nolte, 1974; McIntosh and Nolte, 1975; Nolte and Roelof, 1977], but the first charts to appear in a final, edited form were those for rotations 1523-1525 [Roelof and Krimigis, 1973]. The last chart in the atlas coincides with the commencement of regular publication of edited preliminary synoptic charts in *Solar-Geophysical Data*.

## Synoptic Chart Format

These H-alpha synoptic charts are identical in format and method of construction to those published for the period of Skylab observations [McIntosh, 1975] and for the first year of Solar Cycle 20 [McIntosh and Nolte, 1975]. Each chart is a map of the solar globe during one solar rotation (27.2753 days), much like the Cartes Synoptique prepared by the Meudon Observatory. Patterns are mapped by accumulating positions of features on daily H-alpha filtergrams and are interpreted as magnetic field structures according to techniques previously described [McIntosh, 1972a, 1972c]. The latitude range is  $\pm 70^\circ$ . Solar longitudes are indicated at the bottom and are those tabulated in *The American Ephemeris and Nautical Almanac*, and based on the mean rotation rate for sunspots derived by Carrington. Each chart includes an overlap of  $60^\circ$  with the preceding and following chart. The serial number of each solar rotation is the Carrington number in the series, which commenced November 9, 1853. The dates of central meridian passage at the top are for the solar longitudes directly beneath the date interval. The month and year appearing in the upper-right and upper-left corners of the chart refer to the first and last date, respectively, in the series of central meridian dates. The date in the lower-right corner (e.g., 8/9/74) is the date of preparation of this final version of the synoptic chart to distinguish it from preliminary versions. Initials in the lower-right corner of each chart identify the solar cartographer responsible for the basic work on that chart (see Acknowledgments). All charts were thoroughly reviewed and revised by the author.

The following data are shown on the charts:

- (1) distinct neutral lines (solid lines)
- (2) estimated neutral lines (dashed lines)
- (3) disappearing neutral lines (lines crossed with hachures)
- (4) filaments (cross-hatched areas)
- (5) major sunspots (large solid dots)
- (6) H-alpha plage (stipple, density roughly representing brightness)
- (7) magnetic polarities.

An explanation of these data appears with the discussion of Cartographic Methods.

Each synoptic chart appears at a scale to fill a full page, and its descriptive notes are on the page opposite. This scale, 0.55 mm/degree, is identical to the scale of previously published charts [McIntosh, 1975; McIntosh and Nolte, 1975]. All but two of the charts appear a second time at reduced scale in panels of four to a page; areas of negative polarity are shaded so that the large-scale patterns are emphasized. These panels show the persistence of patterns from one solar rotation to the next, and begin to reveal the nature of proper motions and evolution of large-scale magnetic patterns. The uniform shading indicates a dominance of negative polarity in these patterns. High-resolution magnetograms have shown that small-scale areas of opposite polarity always are present in any given unipolar magnetic pattern.

Polarity signs are missing within the small-scale, cellular features in order to make the charts more legible. The polarity of these regions is always opposite the surrounding area, as confirmed by comparing the full-page charts with their corresponding shaded versions at the end of the atlas.

#### Cartographic Methods

The construction of each H-alpha synoptic chart proceeded through at least five different stages: (1) mapping of conspicuous neutral-line structures (solid lines), (2) addition of more subtle detail that permits interconnections among distinct neutral lines, (3) inference of magnetic polarities, (4) completion of patterns by the addition of "estimated" neutral lines through consideration of the gross distribution of polarities in adjacent areas and, more importantly, of the continuity of large-scale patterns with previous and subsequent solar rotations, and (5) a careful editing through comparison with synoptic charts of measured magnetic fields. These five stages were assigned to a staff of solar cartographers. Two additional rounds of editing were performed by the author: a careful check for general consistency in style and polarities, and a tedious check of every detail while compiling the descriptive notes. Each synoptic chart consumed more than 120 hours of effort. Recent use of computers to digitize and plot the charts has made the process more efficient; but, the majority of effort still requires experienced interpretations and manual integration of information from many images.

*Distinct Neutral Lines.* The distinct neutral lines (solid lines), indicating magnetic polarity reversals, are mapped from various structures visible on once-daily photographs, or filtergrams, taken with patrol telescopes equipped with a birefringent filter tuned to the 6562.8Å line of hydrogen (H-alpha). Filaments, filament channels and plage corridors (Figure 1) are readily identified on low-resolution patrol filtergrams and are the basis for mapping most of the large-scale magnetic patterns. The ability to map more complete magnetic patterns than any previous synoptic chart comes primarily from the recognition of the filament channel as an extension of, and often replacement for, the filament. The filament channel had been described in the literature for number of years, but with different terminology [Kiepenheuer, 1967; Nolan et al., 1970; Rust, 1970], although it was first identified by McIntosh [1970b, 1972a] as a neutral-line structure interconnecting filaments and active regions.

Inference of neutral lines through young and complex active regions requires identifying arch-filament systems [Bruzek, 1967] and "iron-filing" patterns of fine fibrils adjacent to the active region (Figure 2). Detailed discussion of the nature of these structures and a comprehensive referral to published studies of their relationships to magnetic fields are presented by McIntosh [1972a, 1972c].

Positions of all structures lying on and over neutral lines were measured from 12-cm-diameter prints by overlaying the prints with Stonyhurst grids marked with heliographic latitude and central meridian distance in heliographic degrees. Positions of neutral-line structures were manually transferred to graph paper marked with the heliographic coordinates. Computer digitization and coordinate transformation were not available until late in the mapping program. An average of 25 features was measured from each of the approximately 3600 daily photographs. Repeated mapping of identical features from several different photographs provided a thorough check on positional accuracy. The accuracy of coordinates is a function of the nature of the structure, and is usually within 2 heliographic degrees of the correct position.

The patterns are mapped by accumulating the positions of features from a series of daily H-alpha filtergrams. An important observation underlying this atlas is that large-scale H-alpha neutral lines are never completely visible on a single photograph. Only rarely does a filament completely outline a magnetic pattern. More often a neutral line is covered by a series of disconnected filament fragments, or is evident only by the subtle pattern of fine fibrils that form the filament channel. The filaments and filament fragments are constantly changing, disappearing and reforming, so that it is necessary to integrate observations from a complete disk passage in order to detect the complete neutral-line pattern. A filament symbol is placed over a solid line if a filament were observed at that position at any time during the disk passage. Neutral lines mapped by filaments are generally the most accurately mapped neutral lines.

Whenever possible, the H-alpha patterns are the forms seen when the particular features were near W40° on the visible solar hemisphere. This bias permits integrating observations for at least 10 days, including all the days of best visibility of a particular feature.

Whenever a pattern undergoes a conspicuous change from the time of first visibility near east limb to the time at W40°, the former neutral-line position is depicted as a line crossed with hachures (disappearing neutral line). Such changes usually result from the emergence of an active region near a neutral line, or from the merging or splitting of large-scale patterns. Many of the disappearing neutral lines are subjects of discussion in the descriptive notes.

Fig. 1. Representative H-alpha features that map lines of magnetic polarity reversal. See synoptic chart for rotation 1542, left end, for the complete magnetic patterns that are only partially visible in this single photograph. Patrol filter-gram for 2 January 1969 from Sacramento Peak Observatory, Air Force Geophysics Laboratory [from McIntosh, 1972a].

Fig. 2. Inference of the radial-component neutral line in young active regions depends on identifying arch-filament systems (spanning between sunspots upper left to center) and an "iron-filing" pattern of fibrils adjacent to the region (left). The semicircular filament fills a narrow plage corridor and is said to be embedded in the plage. Filtergram obtained with Sacramento Peak Vacuum Tower Telescope at 50-cm aperture.

Active regions are depicted as they appeared at the time of their greatest development. Sunspots are shown only if they were visible in the photographs taken in the center of the H-alpha line. The scale of these synoptic charts is not large enough for detailed mapping of the complex form of neutral lines within active regions, and it is better to use daily, rather than 27-day, charts for active region studies. Here the bright active-region plages are depicted schematically by dense areas of stipple, with the density roughly proportional to brightness. Their inclusion in the H-alpha synoptic chart serves to permit study of associations between large-scale structures and the time, place and magnitude of active regions.

*Polarity Inference.* Plus and minus polarities are assigned by identifying leader sunspots and leading-polarity plage in simple, isolated bipolar plage regions. In Solar Cycle 20, the leading portion of active centers in the Northern Hemisphere was minus (south, inward-directed) polarity and plus (north, outward-directed) in the Southern Hemisphere. Leader sunspots are typically the largest spots in the region, lie at the western end of the group, and are symmetric and long-lived. After assigning polarities to leader spots and plage, polarities are alternated with each inferred radial neutral line. The alternations should occur such that proceeding from one leader spot to another should give the same leading polarity. If an apparently normal bipolar group should receive an assignment of reversed polarities by alternating polarities from an adjacent region, it is likely that an error or omission has occurred in the number of neutral lines inferred. (True reversed polarity regions do occur, but rarely.) Polarity assignment forms an additional check on the accuracy of inferred magnetic patterns.

Inference of magnetic polarities becomes much easier once a series of synoptic charts has been established, for then the persistence of most of the neutral lines from one solar rotation to the next permits carryover of the associated polarities regardless of the presence of active regions. Most active regions form on, or near, a long-lived neutral line that has an established polarity arrangement, providing a ready means of assigning polarities to the new region.

The first and last years in the period of this atlas occurred near times of solar minimum when active regions from the preceding and following solar cycles were present concurrent with Solar Cycle 20 regions. Active regions from those overlapping cycles had polarity arrangements opposite to those in Solar Cycle 20. They can be distinguished in most cases by a distinct difference in solar latitude. Regions of a "new" solar cycle normally occur in the latitude range 25-40°, while the concurrent regions of the "old" cycle occur near the solar equator.

The low level of solar activity during the first 2 years of this solar cycle left large areas of the sun void of structures for inferring magnetic patterns, especially in the sun's Southern Hemisphere. Polarities were assigned only if the structures were clearly associated with an active region or could

be identified as a persistent feature. Polarities are uncertain beyond about 15 heliographic degrees from neutral lines adjacent to large areas void of H-alpha structures. The areas of shading in the small-scale charts have boundaries parallel to the chart coordinate grid where the shading extends toward an area of unknown polarity (see rotations 1488-1511). Mt. Wilson magnetograms provided little assistance for completing the magnetic patterns because they were incomplete and of low sensitivity during this period.

*Estimated Neutral Lines.* A critical and time-consuming stage of the synoptic mapping is the inference of estimated neutral lines that interconnect the distinct neutral lines. This inference is best accomplished after polarities have been assigned wherever possible. The pattern of the polarities will suggest that many of the isolated lines can be connected. In most cases, the re-examination of the H-alpha photographs in the areas of inferred connections revealed subtle structures overlooked in the initial mapping, and provided confirmation of the connection and an accurate position for the neutral line.

A large number of the estimated neutral lines are added after careful study of a time series of synoptic charts preceding and following the chart in question. Continuity of large-scale magnetic features is apparent in any sequence of charts in the atlas, and so it was apparent after the first charts were constructed that the charts themselves were a tool for inferring neutral lines where none had been observed before. Estimated neutral lines were added if there had been a distinct line in its position on earlier charts, and especially if a distinct line formed in its position on a subsequent chart. Only charts for earlier solar rotations were available during the initial work on a chart; therefore, no chart was considered to be in its final form until at least one subsequent chart had been completed and compared with it. For this reason, the initial and final charts in this atlas may undergo further revisions if charts are made for rotations earlier and later than the period of this atlas.

Some estimated neutral lines were added without confidence that the connection or the position of the line was correct. Choices were rather subjective, and based on continuity and upon creating patterns that appeared "typical" for their environments.

It can be seen from the above discussion that the methods for compiling H-alpha synoptic charts require some experience in interpreting solar images as well as care in making measurements. This work testifies that the human mind and senses still perform some perceptual and analytical functions better than present automated systems. Only the first of the five stages of chart construction can be performed with computer assistance and without extensive experience. The remaining four mapping stages require recognition of complex patterns, familiarity with the great variety of forms each neutral-line structure can possess, and experience in dealing with the evolution of these features. Even with careful instruction, each cartographer worked for at least 3 months before successfully completing all five stages of mapping. Temperament, discipline and integrity were important aspects of mapping ability. None of the mapping staff had an understanding of solar physics or the discipline of professional scientific training, so the author performed the final editing and quality control.

#### Descriptive Notes

The descriptive notes accompanying each synoptic chart compensate for the compromise that 27-day charts must make in depicting a dynamic sun. The charts include filaments and active regions no matter where they formed on the visible solar disk and with no indication of how long they were visible. The notes document the dates of formation, disappearance and significant evolution of these features. The times of changes are limited by the use of once-daily photographs, except for dates when there were images at different times from more than one observatory. The notes are listed in decreasing order of solar longitude, which is approximately the order of increasing time. The coordinates are for the centers of the features.

The maximum development of active regions is signified by the classification of their associated sunspot groups, using the revised Zurich classification system [SGD, 1972]. Small and short-lived active regions are not described unless their evolution is unusual. Daily Boulder sunspot drawings were reviewed for information on the active region evolutions and sunspot classifications.

Solar flares and limb events are mentioned only if outstanding or if the event happened to be recorded on the daily photograph used for the solar mapping. No attempt was made to be comprehensive. Proton-producing flares are frequently mentioned since the author has published a number of descriptive studies of their associated sunspot groups. This atlas would be more useful had there been a complete review of daily prominence exposures, both for use in inferring neutral lines and for commentary on limb activity. Such a review was not possible with the available resources.

These notes also serve as a forum for recording structures and evolutions that were unusual from the author's perspective, and for speculating on interrelationships among various patterns and events. It is particularly appropriate that this atlas include such commentary, since the tedious process of compiling these charts involved so thorough a review of every feature on the sun for a 10-year period. Much of what is recorded in these notes has not been recorded before. Many things were noticed that

appeared to be related either spatially or temporally to another structure or event. Some comments occur repeatedly and, therefore, suggest some truth to the speculated associations. The discussion that follows includes several examples of frequently occurring notes.

Active region evolution includes spot motions and the merging of spot groups that form closely in time and position. We have noted these important aspects and how they led to the development of the configurations that distinguished outstanding active regions. Many aspects are noted as unusual, or extreme, examples of region evolutions. We have not presented numerical evidence for the degree of departure from normal.

Other comments hint at physical associations between active regions and nearby filaments and between widely separated filaments. Such large-scale associations suggest that specific, small-scale events may be part of a larger-scale evolution, and that large-scale processes should be examined for the source of energy release in such events.

A frequent comment records the association of disappearing filaments with the birth and/or growth of nearby active regions, a relationship that has been often noted before. A new causal agent for disappearing filaments is suggested by filament disappearances occurring between large-scale patterns prior to the merger of those patterns. Large-scale convergence may force major adjustments in large-scale solar magnetic fields. Such convergence is readily apparent by study of the time sequences of shaded synoptic charts.

Some comments record the sense of twist in vortical fine structure or relative sunspot motions, and carefully note the association of solar hemisphere with the sense of twist. These notes confirm the statistics of Hale [1927] and Richardson [1941] that most active regions with vortical development have clockwise motions in the Southern Hemisphere and counterclockwise motions in the north. The observations point to large-scale processes influencing fine structure and evolution within active regions.

One of the most significant observations to come from this atlas is apparent variability of solar rotation with time and longitude, confirming early impressions of the motions of large-scale neutral-line patterns [McIntosh, 1972b]. These variations are surely the superposition of a pattern of global solar circulation upon the mean differential solar rotation (variation of rotation rate with latitude). The notes mention specific anomalous "rotation rates" of active regions and associated large-scale neutral lines, and suggest that the active regions shared the rate of motion of their associated large-scale patterns. Such evidence conflicts with the prevailing idea that the large-scale magnetic fields are but the remnants of active-region fields that have been scattered by random-walk diffusion. It is hoped that these notes will stimulate a fresh examination of relationships between active regions and large-scale solar magnetism.

#### Reliability

The reliability of these charts as magnetic patterns has been challenged because of connotations attending the word *inferred*. There should be little reason to suspect the veracity of the distinct neutral lines inferred from structures with long-established relationships to solar magnetic fields. The repeated mapping of details from sequences of daily photographs provided confirmation of positions and verification of true neutral-line structures as separate from transient, filament-like features. The methods for inferring polarities provided a thorough system of checks and balances on polarity accuracy.

Significant confirmation of the reliability of H-alpha-inferred neutral lines came from comparisons between these data and the X-ray coronal structure observed from Skylab [McIntosh, et al., 1976]. The fit between neutral lines and arcades of X-ray arches (which appear to outline three-dimensional magnetic fields) is so detailed that it should be possible to infer three-dimensional coronal arcades from the H-alpha observations. This study confirmed the interpretation of H-alpha patterns as coronal structures that resulted from studies of interplanetary phenomena [Roelof and Krimigis, 1973].

All H-alpha synoptic charts were compared with synoptic charts of measured photospheric magnetic fields provided by the Mt. Wilson Observatory. The detailed agreement between the H-alpha neutral lines and magnetograms in Figures 3 and 4 is typical of the agreement found throughout the atlas. Daily, full-disk magnetograms were used when questions arose concerning activity near the solar limbs, since the synoptic magnetic maps use central-meridian measurements whenever possible. The use of the magnetic field maps hastened analysis of the polarity situations during the initial stage of constructing the H-alpha charts. The measured data were especially useful within complex active centers and in areas of extensive dashed-line neutral lines.

The sensitivity of the magnetograms was normally insufficient to give data in just those areas that were void of H-alpha structures, as if the lack of chromospheric organization were directly related to the very low strength of the magnetic fields. There were some areas, however, where a distinct filament channel could be observed in an area without appreciable signal on the Mt. Wilson magnetograms. These instances probably reflect the inability of the magnetograph to record the transverse magnetic-field component that is most likely responsible for the patterns of fibrils making up the filament channel.

Fig. 3. Above: H-alpha filtergram for 4 June 1968 at 1359 UT from the NOAA solar observatory, Space Environment Services Center, Boulder, Colorado. Below: A low-resolution magnetogram from Mt. Wilson Observatory for the same date superposed with inferred lines of polarity reversal derived from the filtergram. Contours of positive polarity are solid lines and contours of negative polarity are broken lines [from McIntosh, 1972a].

1967, ROTATION N° 1523

H $\alpha$  SYNOPTIC CHART  
1967 - ROTATION 1523

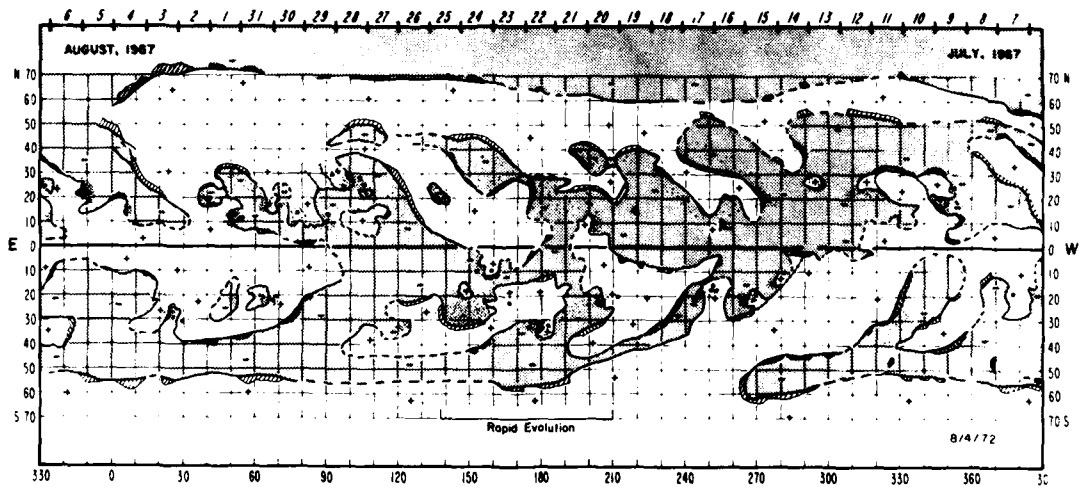

Figure 4. Comparison of an H-alpha synoptic chart with Carte Synoptique (top) from the Meudon Observatory and with a Mt. Wilson synoptic chart of photospheric fields (bottom) for the same solar rotation.

The thorough intercomparison of H-alpha and magnetic charts revealed examples of measured data that were in error or excessively noisy. The limitation to measuring only the line-of-sight component of the magnetic field gave neutral-line patterns in regions near the solar limb that were inconsistent with the inferred patterns, and inconsistent with the measured patterns at disk center for the same active areas. Especially complex active regions occasionally were measured with a pattern inconsistent with the inferences, probably reflecting the presence of significant transverse field components in such regions. Other magnetogram errors appeared as errors in data processing, such as shifts in positions of features or reversal of polarities from measurements made on adjacent daily magnetograms. This intercomparison confirmed that most of the discrepancies between measured and inferred magnetic fields can be resolved in favor of the inferred data [McIntosh, 1972a].

Maps of photospheric neutral lines have been derived recently from solar mean field measurements at Stanford University. Comparisons of these maps with preliminary and incomplete H-alpha synoptic charts was very favorable, especially in areas containing distinct neutral lines (mapped from conspicuous structures) [Duvall et al., 1977]. Dashed lines were erroneous in position in about half the cases, but the interconnections they represented were almost always correct. Inasmuch as the Stanford measurements correlate closely with interplanetary sector structure [Scherrer et al., 1972], we anticipate that this atlas of neutral-line charts will offer a fresh perspective for the study of the solar origin of interplanetary magnetic sectors.

Further evidence that the methods for adding dashed lines are valid was provided by Nolte and Roelof [1977]. Their correlation between H-alpha-inferred and interplanetary polarities was divided between definite H-alpha polarities (defined by solid lines on the charts) and estimated polarities (defined by dashed lines). There was no significant difference in the correlation coefficients from the two data sets. The degree of the correlations is at least as good as those derived from use of solar magnetogram polarities [McIntosh and Roelof, 1972].

#### Uses for H-alpha Synoptic Charts

We conclude this text with a brief summary of uses for H-alpha synoptic charts in solar-terrestrial research and services. The following qualities give the charts special value in these applications:

- 1) high-resolution of boundaries to large-scale magnetic patterns
- 2) accurate delineation of neutral lines in areas of weak magnetic fields
- 3) correlation of neutral lines with arcades of magnetic arches in the low corona [McIntosh et al., 1976]
- 4) correlation of H-alpha-inferred polarities with both the solar mean field and the interplanetary magnetic field [Duvall et al., 1977; Nolte and Roelof, 1977; Roelof, 1974]
- 5) correlation of "gaps" in the polar-crown neutral lines with high-latitude coronal holes [McIntosh, 1976]
- 6) uniform quality and complete coverage for an entire solar cycle, including nearly all the Space Age
- 7) potential for inferring solar photospheric magnetic fields, solar coronal magnetic fields, and interplanetary magnetic fields from H-alpha photographs back to the beginning of the century
- 8) ability to obtain these charts in "real-time" for use in solar-terrestrial monitoring and predictions
- 9) availability of H-alpha observations to institutions without budgets for solar magnetographs.

The foremost motivation for producing this atlas was the desire to understand the morphology and dynamics of the large-scale magnetic patterns so clearly seen in the early synoptic charts. The series of shaded synoptic charts is worth prolonged study to appreciate the relative movements, mergers, divisions and expansions of individual, long-lived features. These movements will be analyzed as rates of solar rotation as functions of latitude, longitude and time to give a detailed history of large-scale solar circulation through a complete solar cycle. This information will be examined for correlations with the rise and fall of sunspot activity, for reasons differences exist in solar activity levels between Northern and Southern Hemispheres, and for clues to the nature of the polar polarity reversal that occurs about 2 years after solar cycle maximum. The relationships between centers of flare activity and these large, long-lived patterns are of particular interest to NOAA's Space Environment Services Center, as they may provide the first capability for long-range solar activity predictions. There is a strong sense of order among these large-scale evolutions, promising predictability and the development of the first empirical, dynamic model of the solar cycle.

We have already alluded to the successful correlations between portions of this atlas and the measurements of interplanetary magnetic fields. Analysis of the complete atlas should provide

fundamental insights into the origin and evolution of the sector patterns in the interplanetary fields, and from this understanding will come improved predictions of the several geophysical responses to the sector boundaries passing by the earth. This understanding will stem from analysis of specific physical structures that appear to be the sector boundaries on the solar surface, a significant advance over previous studies that were statistical in nature.

Support to produce this atlas came as a result of successful use of early synoptic charts in investigations of the solar sources of energetic particles, interplanetary magnetic fields and solar wind [e.g., Roelof and Krimigis, 1973; Nolte, 1974; Roelof, 1974; Krieger et al., 1975; Roelof et al., 1975; and Nolte and Roelof, 1977]. These investigations established that all these parameters are strongly controlled by the coronal structures that conform to the large-scale patterns of neutral lines. This atlas, and the preliminary synoptic charts now appearing regularly in *Solar-Geophysical Data*, will provide a means for examining solar particle behavior over an entire cycle and possibly will lead to new interpretations of many of the important past particle events.

The H-alpha synoptic charts have proven useful in studies of the nature of filaments and the significance of filament disappearances [Serios et al., 1978; Webb et al., 1978]. Entries in the descriptive notes suggest that the relative motions of adjacent, large-scale magnetic patterns have an influence on the formation and eruption of filaments.

The ease with which these charts can be made in "real-time" with patrol photographs that are readily available enables the regular publication of preliminary H-alpha synoptic charts in the weekly *Preliminary Report and Forecast of Solar-Geophysical Activity* and in the more definitive monthly *Solar-Geophysical Data*, both produced by NOAA. The initial "quick-look" versions are generated for daily use in the Space Environment Services Center. They are used in combination with solar mean field data from Stanford University, coronal hole data from Kitt Peak National Observatory and geomagnetic indices from the USGS magnetic observatory at Fredericksburg, Virginia, to make long-range forecasts of geomagnetic activity and to serve as a record of all active regions. The forecasting operation anticipates use of the charts in future numerical prediction methods involving daily analysis of the large-scale dynamics of solar magnetic patterns.

#### Future Solar Mapping

Whether H-alpha synoptic charts are made in the future depends on the continuation of H-alpha full-disk patrols. At the time of this writing there is serious doubt about their continuation. These observations have been increasingly ignored because they have suffered under the misnomer of "flare patrols," implying simply a detector of flare events. This atlas is evidence of the rich material on active and inactive fine structures contained in these patrol films. While these fine structures are better recorded in the high-magnification images from the larger telescopes, the mapping of their coordinates must be done from full-disk patrol images. The mapping of complete magnetic patterns, and the use of such maps for daily solar-terrestrial services, depends on the constant availability of observations only a global network of observatories can provide.

The adoption of improved, fine-grain films sensitized for H-alpha marked the beginning of a new era in H-alpha patrols in 1965, permitting the routine recording of the fine structure of filament channels and active regions upon which H-alpha synoptic charts depend. Films and measuring methods have continued to improve, yet decreasing interest has allowed these patrols to remain at the quality achieved 15 years ago. Inferred magnetic patterns could be measured with a precision greatly exceeding the material in this atlas. Daily positions of neutral-line features with high precision could reveal a host of dynamic phenomena of importance to solar physics. Current synoptic charts are produced with a simple computer digitizer and plotter. High-resolution mapping of solar magnetic patterns will require more sophisticated equipment, with measurements directly from films instead of photographic prints, as in the present system. Improvements in the quality of the full-disk H-alpha patrol films would enhance their use as an economical means of monitoring the sources of interplanetary and terrestrial disturbances.

A part-time effort has begun at NOAA to digitize this atlas so that intensive analysis can be performed by computers. It is intended that these data files will be available to everyone through the services of the NOAA World Data Center A for Solar-Terrestrial Physics.

#### Acknowledgments

Dr. E.C. Roelof of the Applied Physics Laboratory of Johns Hopkins University was the first to share my recognition of the many uses for H-alpha synoptic charts, and his unflagging dedication to this project in terms of financial and personnel assistance made it possible to undertake this large task. Drs. M.A. Shea and D.F. Smart of the Air Force Geophysics Laboratory expressed great trust and faith through repeated contract renewals in spite of seeing only portions of finished work.

The process of tediously transferring photographic detail into synoptic charts was borne by a dedicated staff consisting of: Janice E. Leighton (JEL), Sharon L. Osborne (SLO), Susan C. Wayland (SCW) and Susan A. Andrews (SAA), with additional help from Anna Marie Robb (AMR), Philip Townsend (PVB), Robert E. Gold (REG) and William Van Orman (WVO). Dr. Jerome T. Nolte (JTN) did the major part of the mapping for the first 12 solar rotations as part of his Ph.D. thesis. The initials following each of the preceding names are those that appear in the lower-right corner of each chart. Some of the descriptive notes were contributed by J.T. Nolte, Ann Hardgrove, William Flowers, and Susan Wayland.

Mrs. Leighton and Mrs. Wayland were invaluable for maintaining the project organization, performing initial training for some of the other cartographers and writing progress reports. Mrs. Leighton also produced the preliminary "real-time" synoptic charts for the NOAA Space Environment Services Center during 1975-1976. These assists beyond the duties of solar mapping made it possible for me to carry on my responsibilities to the Space Environment Laboratory and concentrate on management and editing aspects of the mapping project.

My wife, Judy, contributed patience and moral support and even some detail on some of the synoptic charts! I am grateful for her understanding and for sharing in the excitement of discovery.

Special thanks go to my supervisors during this 7-year period: Mr. Robert Doeker, Chief of the Space Environment Services Center; Mr. Gary Heckman, successor to Mr. Doeker; Dr. Harold Leinbach, Program Leader for Solar Physics; and Dr. Donald Williams, Director of the Space Environment Laboratory. They were generous in permitting me to take time from other assignments and in providing space for the temporary staff of solar cartographers.

Dean Eicher of the U.S. Department of Commerce drafting department in Boulder, Karen D. Runkles of The Johns Hopkins University and Janet Varney of the University of New Hampshire demonstrated unusual dedication and skill in transforming the original synoptic charts into their final forms. Their contributions exceeded the requirements of their assignments.

This atlas is derived from the extensive collection of daily H-alpha photographs acquired by the NOAA Space Environment Services Center (formerly, Space Disturbance Forecast Center of ESSA) since 1965. Images from 1964 through 1969 came from the Sacramento Peak Observatory (U.S. Air Force Geophysics Laboratory) at Sunspot, New Mexico; 1967 to the present from the NOAA observatory in Boulder and 1970 to 1974 from the U.S. Air Force solar observatory at Ramey Air Force Base, Puerto Rico.

Dr. Robert Howard of the Hale Observatories kindly provided synoptic magnetograms from Mt. Wilson Observatory prior to their publication. Magnetograms for the period 1964-1966 came from Howard et al. [1967].

The author extends his gratitude to Dr. Harold Leinbach for reviewing this document and providing valuable criticisms.

Portions of this project were supported under contracts from the Air Force Geophysics Laboratory (formerly Air Force Cambridge Research Laboratories) to the University of New Hampshire and The Johns Hopkins University through the years 1972-1977. Early portions of the work were supported by NASA Contract H42710-A.

APPENDIX A  
Annotated Full Scale Synoptic Charts

# H $\alpha$ SYNOPTIC CHART 1964 - Rotation 1487

*Long.	*Lat.	Date	Descriptive Notes
25	N25	10/27	Birth of short-lived plage; dissipated on 29 October.
17	S20	10/27	Filament disappeared. It gradually re-formed and became visible as a prominence by 4 November.
5	N20	10/30	Birth of faint plage, with spot group visible for 1 day.
345	N34	11/3	Birth of bipolar plage with spot group visible only this day.
335	N34	11/5	Large filament developed near west limb.
318	S06	10/31	Birth of bipolar plage with spot group.
295	N07	11/2	Filament disappeared.
285	N32	11/4	Filament disappeared.
118	N18	11/7	Birth of bipolar plage 31 October. Small filament formed this day only.
240	S40	11/9-10	Filament disappeared.
215	N09	11/14	Birth of bipolar plage with spot group.
206	N37	11/14	Filament disappeared.
205	N34	11/4	Birth of bipolar region; spots formed by 7 November.
180	N30	11/12	Birth of bipolar plage with spot group.
150	S05	11/9-10	Filament disappeared.
135	N20	11/15	Birth of bipolar plage; formed type C spot group. Most important active center of this rotation.
125	N37	11/19	Birth of bipolar plage with spot group.
70	S20	11/18	Filament disappeared.
52	N23	11/22	Filament disappeared.
51	S10	11/21	Filament disappeared.
37	Equator	11/23	Birth of small bipolar plage.
35	N50	11/21	Filament disappeared.
20	N17	11/28	Birth of bipolar plage with spot group.

Note: Days without H-alpha photographs were 13, 18, and 29 October and 9, 11, 18, and 26 November 1964

# HQ SYNOPSIS CHART 1964- ROTATION 1487

H $\alpha$  SYNOPSIS CHART  
1964 - Notation 1488

*Long.	*Lat.	Date	Descriptive Notes
351	N27	11/24	Birth of bipolar region with spot group; additional growth on 1 December.
305	N30	11/29	Birth of small plage; gone by 1 December.
140	N22	12/13	Birth of bipolar region.
110	S42	12/16	Filament disappeared.
97	N07	12/19	Birth of bipolar region.
58	N23	12/15	New growth in small, old active region.
22	S10	12/14-15	Bipolar region probably born near east limb.
15	N15	12/18	Filament disappeared.

Note: Days without H-alpha photographs were 26 November and 2-5, 8, 16, 18 and 22 December 1964.

# HQ SYNOPSIS CHART 1964 - ROTATION 1488

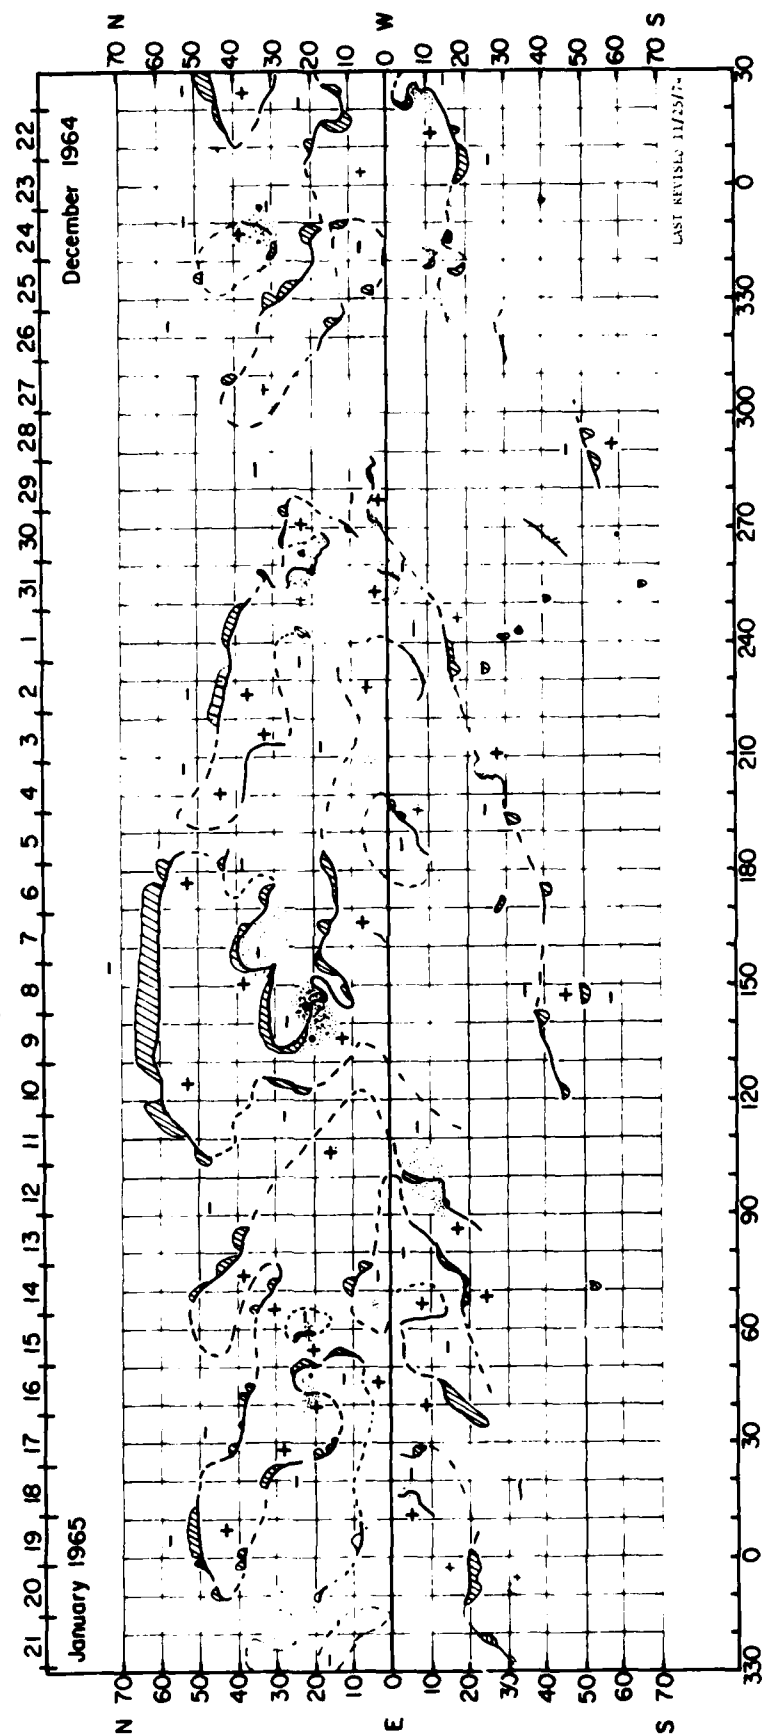

H $\alpha$  SYNOPTIC CHART  
1964-1965 - Rotation 1489

°Long.	°Lat.	Date	Descriptive Notes
340	S10	12/19	Birth of active region.
271	N02	12/28	Birth of bipolar region.
260	N22	12/28	Birth of bipolar region with spot group; additional growth on 31 December.
255	S01	12/26	Probable date of birth of bipolar region with spot group.
245	N40	1/3	Filament appeared only on this day.
225	N45	12/29	Filament disappeared.
210	N05	1/3	Birth of short-lived, faint plage.
205	S27	1/5	Birth of bipolar region with spot group visible for 1 day.
178	N14	1/10	First appearance of filament.
162	N03	1/9	Only appearance of small bipolar region with bright plage.
135	N28	1/5	Filament disappeared; re-formed by 8 January.
125	N25	1/8	Filament faintly appeared, completely visible by 9 January, and possibly disappeared at west limb 14-15 January.
45	N20	1/13	Birth of bipolar region with spot group; additional growth on 17 January.
40	S15	1/14	Filament disappeared.
20	S04	1/18	Mt. Wilson magnetogram noise level approximately same as the strength of this plage.
18	N16	1/17	Birth of small, short-lived, bipolar region.
16	S04	1/16	Birth of bipolar region.
10	N16	1/17	Birth of small, short-lived, bipolar region.

Note: Days without H-alpha photographs were 22, 25, 27 and 31 December 1964 and 1, 6-7, 12, 14 and 20 January 1965.

# HQ SYNOPSIS CHART 1964, 1965 - ROTATION 1489

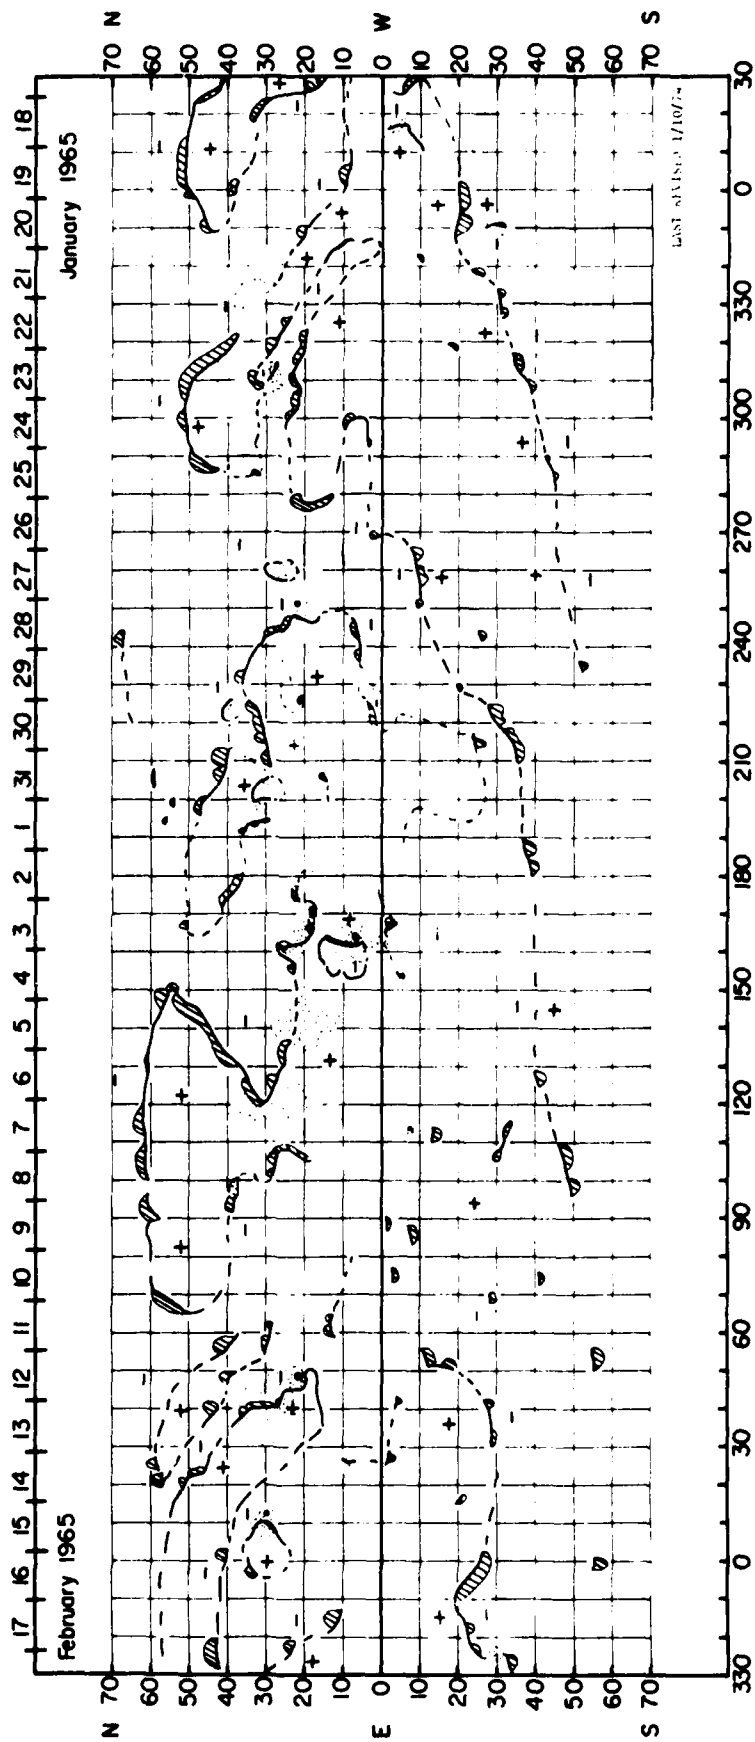

H $\alpha$  SYNOPTIC CHART  
1965 - Rotation 1490

*Long.	*Lat.	Date	Descriptive Notes
355	S20	1/17	Filament disappeared.
350	S30	1/23-24	Birth of bipolar region.
314	S35	1/25	Small filament disappeared.
311	N29	1/18	Birth of bipolar region with spot group; additional growth on 26 January.
280	N20	1/22-27	Variable filament; disappeared on 27 January.
264	S08	1/29	Small filament disappeared.
202	N31	1/27	Birth of bipolar region with spot group.
175	N41	1/28	This filament appeared only on this day at east limb.
162	N07	2/5	Two-ribbon proton flare followed disappearance of filament within small, declining spot groups; one of last active regions of Solar Cycle 19.
160	N22	2/6	Birth of small bipolar region with spot group
105	N25	2/4	Filament disappeared.
78	N08	2/12	Birth of bipolar region with spot group.

Note: Days without H-alpha photographs were 23 January and 1, 7-10 and 15 February 1965.

Last Revision 1/8/76 SCW

H $\alpha$  SYNOPTIC CHART  
1965 - Rotation 1500

*Long.	*Lat.	Date	Descriptive Notes	*Long.	*Lat.	Date	Descriptive Notes
355	N21	10/18	Small region born 18 October. Attained maximum size with small class C spot group on 21 October.	65	N25	11/5	Birth of active region near east limb; reached maximum with very small spot group by 7 November. Decayed rapidly, especially after formation of a strong new region a few degrees east.
352	S05	10/15	Only appearance of small filament.	S08		11/10	Birth of small region, which disappeared by 13 November.
350	N23	10/14	East limb passage of faint region with inferred reversed polarity arrangement.	N25		11/9	Birth of active region, which grew rapidly to small type B spot group by 11 November. Spot group nearly gone by west limb passage 17 November.
		10/17	Filaments within the faint plage and north of the region disappeared same day.	41	Equator	11/10	Birth of small bipolar region on equator, which only grew slightly and disappeared on 13 November.
		10/19	Birth of new active region in position of the faint plage, which had disappeared by this date.	36	N17	11/11	Filament disappeared.
		10/21	Maximum development of new region with moderate size class C spot group. Only minor decrease in plage by west limb passage 25-26 October.	20	S12	11/14	Small filament appeared only on this day.
315	N33	10/24	Long row of filaments most prominent on this day.				
258	M18	10/24	Small region born.				
255	S08	10/31	Tiny plage born.				
245	N17	10/23	Small region born.				
240	N48	10/26	Filament disappeared.				
230	S22	11/2	Large filament within large, faint plage disappeared near west limb.				
205	N12	10/30	Filament in small, old active region gradually disappeared.				
198	M10	10/31	Birth of active region which reached maximum 3 November with small spot group.				
195	N25	10/31	Filament disappeared 31 October, reappeared 1 November, and developed rapidly into a continuous filament along the neutral line to north and west. Filament continued to enlarge and elevate until west limb passage 6 November.				
150	M50	11/4-9	Filament was highly variable. First distinct 4 November, re-formed 7 November and disappeared 9 November.				
114	M26	11/5	Rapidly developing region appeared adjacent to decaying region. Large type E spot group reached maximum size 7 November.				
108	N33	10/31	Active region with small spot group was apparently just past maximum size at east limb on 31 October. It slowly decayed until 6 November and rapidly decayed thereafter, as if rapid growth of nearby large region influenced its demise. Region contained complex magnetic pattern that was not clearly discernible in H-alpha.				

Note: Day without H-alpha photographs was 15 November 1965.

# H $\alpha$ SYNOPTIC CHART 1966 ~ ROTATION 1503

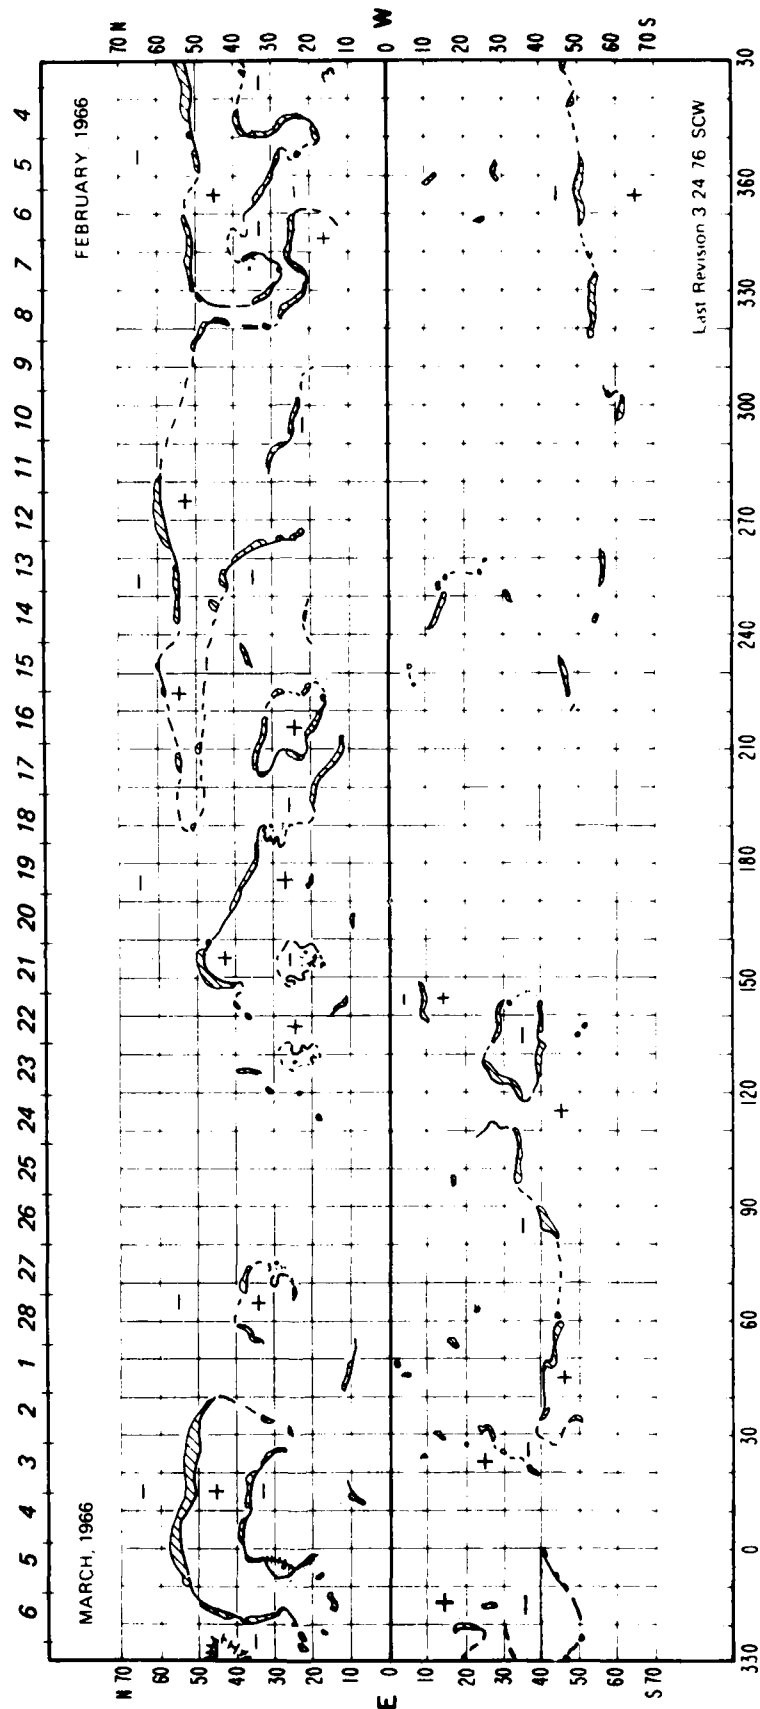

# H $\alpha$ SYNOPSIS CHART 1966 - Rotation 1504

*Long.	*Lat.	Date	Descriptive Notes
359	S12 N30	2/2 2/4	Filament fragment visible this day only. Filament in faint, scattered plage plainly visible this day only.
338	N35	2/1 2/2	Region formed at east limb. Sunspots first observed. Attained maximum as follower-dominant type C group by late 3 February.
	N25	2/10 2/3	Minor additional spot growth. Curved filament disappeared.
327	N23	2/7	Filament in faint plage disappeared.
325	S53	2/11	Filament disappeared.
290	N25	2/8	Filament formed.
210	N22	2/16	Filament disappeared, associated with extensive faint plage.
195	N20	2/17	Filament disappeared.
187	N30	2/12	Birth of active region at east limb. Reached maximum as small type C group by 18 February. Greatly diminished by west limb passage 24 February.
175	N36	2/20	Filament disappeared.
152	N22	2/17	Birth of significant active region at longitude 149, 7° east of small spotless plage. Growth and motion of region eliminated all traces of small older region by 22 February. New region attained maximum on 21 February as a type D group with numerous spots.
135	S28	2/21	Filaments disappeared along northern boundary of large-scale cell of negative polarity that represented the remnant of a small active region from the previous solar rotation.
132	N23	2/20 2/24	Birth of significant active center. Formation of additional bipolar spot group at follower end of earlier region; the two groups merged to form a single and increasingly complex region as west limb passage occurred on 28 February. An extremely large, complex, active region appeared on Rotation 1505 between the center noted here and the region at longitude 152.
70	N28	2/22	Birth of active region at east limb. Reached maximum next day as small type C spot group.
53	S43	3/6	Filament disappeared.

Note: Days without H-alpha photographs were 9 and 25-26 February 1966.

# H<sub>α</sub> SYNOPTIC CHART 1966 - ROTATION 1504

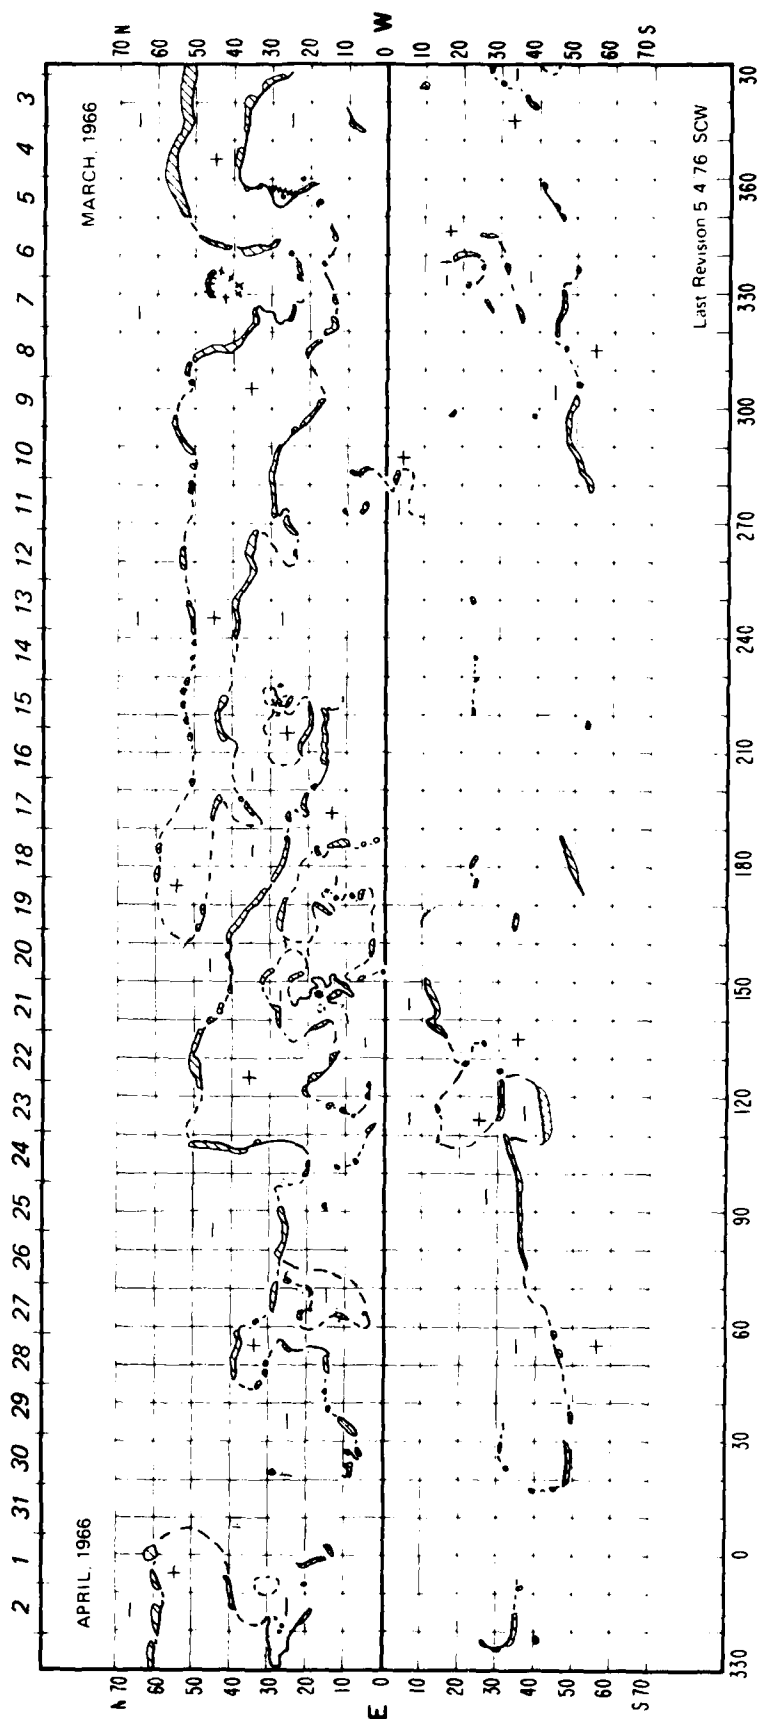

H $\alpha$  SYNOPTIC CHART  
1966 - Rotation 1505

*Long.	*Lat.	Date	Descriptive Notes	*Long.	*Lat.	Date	Descriptive Notes
357	N22	2/27	Birth of active region at east limb. Reached maximum next day as small type C spot group. Note that this was another in a series of active regions that formed at, or near, east limb during February 1966. (See notes for Rotation 1504.)	63	N22	3/29	Birth of bipolar region with spots. Decayed steadily from this day to west limb passage on 1 April.
352	N27	3/4	Region born that affected neutral line to its west; reached maximum 6 March as a type B spot group, but developed H-type leader after follower spots disappeared. Important new spot growth near west limb. Returned next rotation as a great region.	21	N26	4/3	Birth of tiny bipolar region.
342	N30	3/3 3/4	Filament disappeared. Filament reappeared; active region formed near south-west terminus.	7	N39	4/4	Birth of very small active region near west limb.
330	N45	3/4	Filament disappeared.				
315	N45	3/4 3/6 3/9	Filament disappeared at east limb. Filament re-formed and was active next 2 days. Filament disappeared.				
285	N29	3/9	Filament disappeared.				
283	N07	3/5	Small filament, dark and elevated above small bright plage; plage faded and filament became much smaller next day.				
205	S47	3/5 3/7 3/11	Filament disappeared. Filament reappeared. Filament disappeared again.				
185	N12	3/15 3/20	Filament visible this day only. Filament formed; only partially visible next 2 days.				
145	N18	3/15	East limb passage of the first great flare-rich region of Solar Cycle 20. The large, bright, complex plage contained a large, round, rapidly evolving sunspot group with strong "delta" magnetic configuration. The configuration of the neutral lines near the sunspot may not be correct as mapped here, although the large-scale magnetic environment is correct. Approximately 200 flare events were reported during the disk passage, including proton emission.				
	N30	3/25	Especially large filament formed before west limb passage.				
115	S42	3/18	Filament disappeared.				
97	N25	3/28	Birth of small active region with tiny spots. No spots were observed the next day.				
85	N25	3/22	Filament disappeared.				

Note: There were no days without H-alpha photographs.

# H<sub>α</sub> SYNOPTIC CHART 1966 - ROTATION 1505

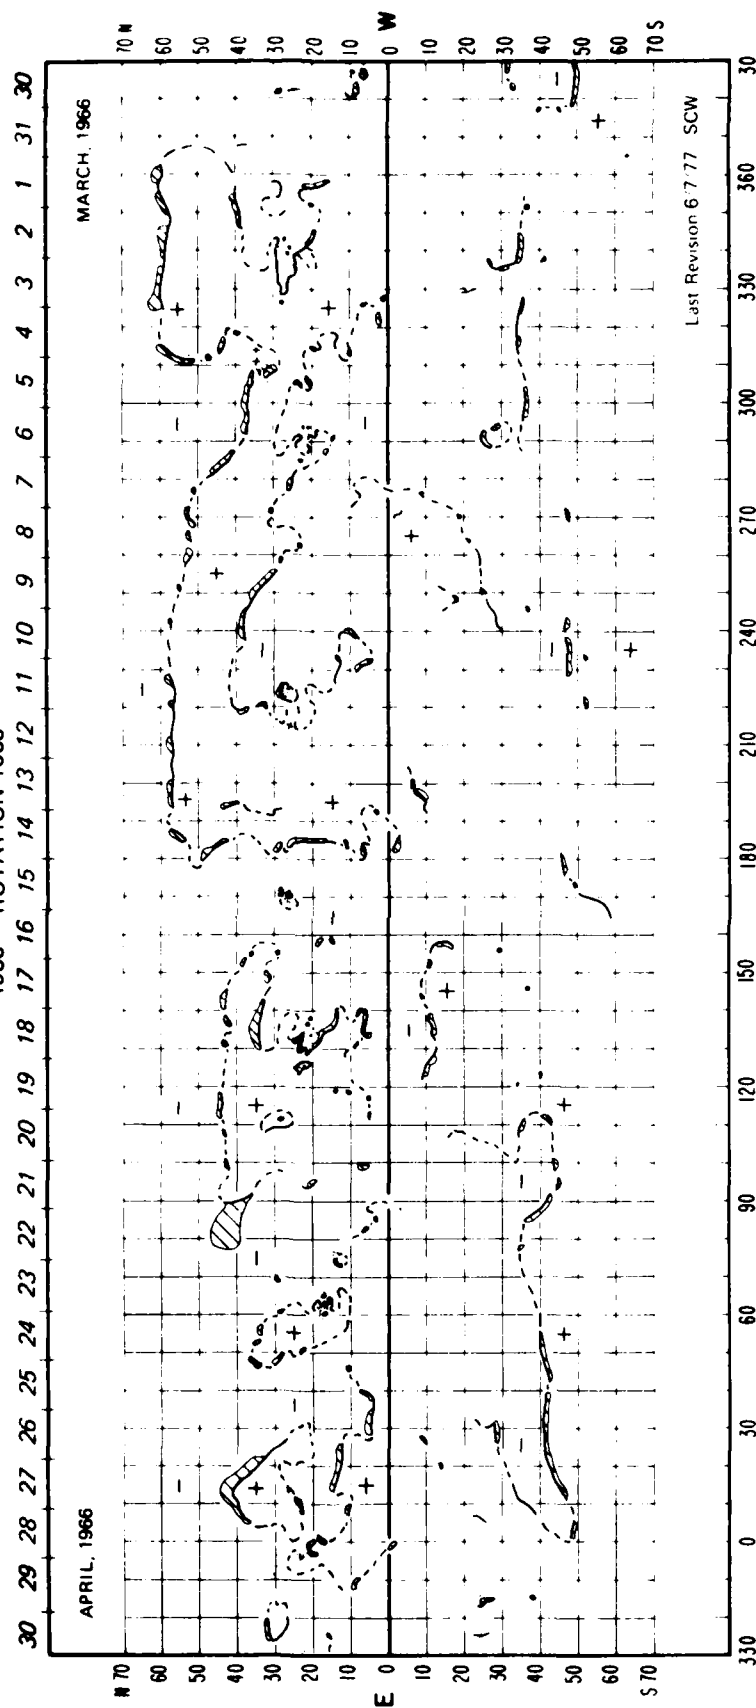

H<sub>α</sub> SYNOPTIC CHART  
1966 - Rotation 1506

*Long.	*Lat.	Date	Descriptive Notes	*Long.	*Lat.	Date	Descriptive Notes
354	N28	4/3 4/6	Birth of active region. More rapid growth and spot development, which continued at west limb passage 7-8 April.	135	N35	4/15	Filament disappeared.
350	N39	3/29	Filament disappeared.	125	N23	4/19	Small isolated cell of negative polarity in trailing part of large aging region disappeared by this date.
340	S35	3/31	Filament disappeared.	108	N28	4/22	Birth of active region, which reached maximum 24 April as type D group with numerous spots. West limb passage was 25 April.
335	N26	3/27	East limb passage of great active region that apparently formed just before rotating into view. Located almost on opposite side of sun from great region that was completing west limb passage on this date.	90	N40	4/23	Large and very active filament disappeared.
		3/27-4/2	Period of significant growth of spots and important relative proper motions among the spots. The region behaved as two overlapped bipolar groups with significant differences in their rates of solar rotation. The largest leader and follower spots rotated faster than neighboring small spots, leading to a merger of like-polarity spots by 1 April. The region greatly simplified after central meridian passage on 3 April.	75	N12	4/24 4/26	Birth of tiny active region. Additional minor growth.
329	S21	4/4	Birth of tiny active region that disappeared 2 days later.	63	N17	4/20	Birth of moderate active region, which reached maximum 24 April as type D group with numerous spots.
314	N17	3/30	Filament disappeared.	30	S41	4/23	Filament disappeared.
307	N32	4/5	Birth of active region, which reached maximum by 8 April as a small type C spot group.				
303	N37	4/7	Filament disappeared.				
293	S27	4/1	Birth of small active region.				
290	N22	4/3	Minor plage growth in small region and appearance of first sunspots.				
		4/5 4/8	Beginning of more rapid growth. Maximum sunspot development as type E spot group, but areas of additional spot growth appeared daily until west limb passage 12 April.				
271	S02	4/9	Birth of tiny plage, which disappeared by 11 April.				
270	N52	4/3	Filament disappeared. Gradually re-formed during disk passage.				
225	N28	4/16	Plage growth (without reported spots) within extensive faint plage.				
219	N37	4/10	Filament disappeared.				
185	M15-55	4/13	Development of filaments along this meridian marked formation of important large-scale boundary that could be identified for next 3 solar rotations.				

Note: There were no days without H-alpha photographs.

1966 - ROTATION 1506

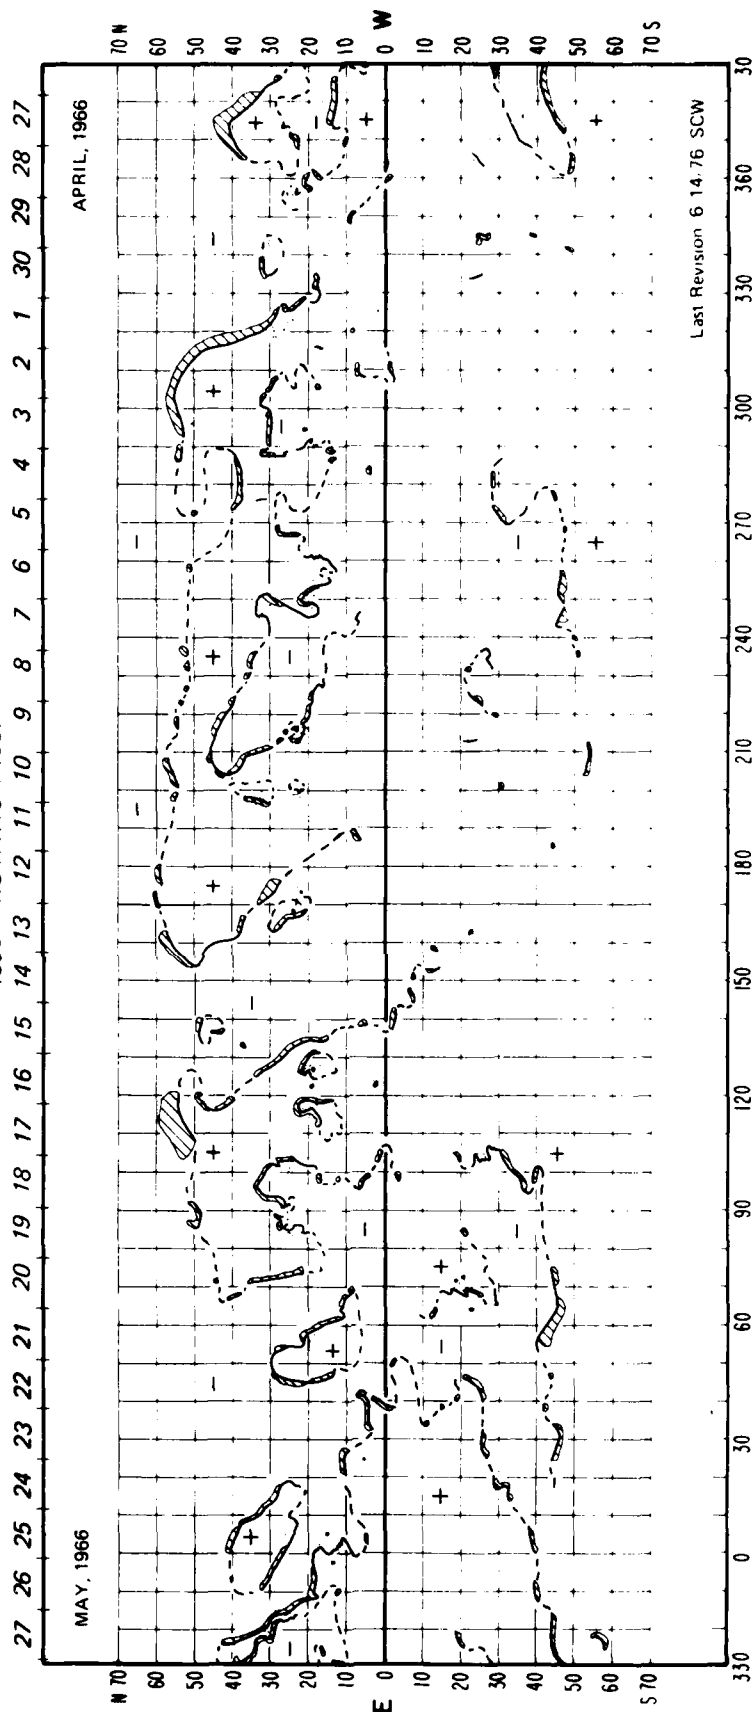

H $\alpha$  SYNOPTIC CHART  
1966 - Rotation 1507

*Long.	*Lat.	Date	Descriptive Notes	*Long.	*Lat.	Date	Descriptive Notes
357	N23	4/30	Birth of active region with small spot group, which grew slowly to maximum by 3 May, 1 day before west limb passage.	100	S33	5/16	Filament began to form and reached fullest development 19 May.
355	N28	5/2	Birth of small active region.			5/20	Filament disappeared.
345	S25	4/23	East limb appearance of tiny bright plage, which faded during next 2 days.	68	S19	5/18	Small sunspots formed within large faint plage.
334	S23	4/28	Birth of small region with tiny spots, which grew slowly to maximum area by 2 May.			5/20	Rapid spot growth began; region reached maximum on 23 May as a class E spot group.
325	N02	5/2	Birth of tiny plage, which disappeared by 6 May.	10	N34	5/24	Filament disappeared. Filament gradually reformed and became exceptionally large by 29 May, just before west limb passage.
290	N17	4/29	Filament disappeared.				
290	N21	5/6	Minor new spot growth in region that had returned for second disk passage 27 April with a large single leader spot. Plage was primarily in the follower portion of the region when at east limb. Plage formed gradually near leader spot during the disk passage, culminating in the spot formation on 6 May. Large leader spot decayed more rapidly after this date.	2	N14	5/19	East limb passage of complex region, which may have formed just a few days earlier. Region grew to maximum on 21 May as class E spot group.
275	N32	5/10	Birth of small active region.			5/22	Rapid decrease in sunspot area began.
248	N20	5/2	Birth of small active region, which began to decline next day with very small spots. Blended with faint plage to west by 3 May.			5/30	Sunspots entirely gone.
		5/5	Semicircular filament formed within and between this region and region to the west.				
245	N31	5/3	Birth of small active region.				
241	N12	5/5	Birth of small active region that dissipated by 10 May.				
240	N29	5/3	Filament disappeared.				
		5/4	Filament reappeared.				
		5/7	Filament disappeared.				
		5/9	Filament reappeared.				
213	S22	5/15	Birth of very small region just before west limb passage.				
200	N23	5/12	Birth of small active region.				
170	N23	5/13	Birth of active region that reached maximum on 15 May as class D spot group.				
	N35	5/15	Filament disappeared.				
125	N19	5/19	Birth and rapid growth of active region that reached maximum on 21 May as a follower-dominant class D spot group.				
117	N20	5/19	Semicircular filament began to disappear gradually in apparent response to the growth of a nearby active region.				

Note: Day without H-alpha photographs was 10 May 1966.

H $\alpha$  SYNOPSIS CHART  
1966 - Rotation 1508

*Long.	*Lat.	Date	Descriptive Notes	*Long.	*Lat.	Date	Descriptive Notes
358	N28	5/24	Filament disappeared.	177	N28	6/12	Filament formed within a decaying active region.
344	N28	5/25	Filament disappeared.	153	N27	6/14	Birth of a small region 2 days before west limb passage.
335	S35	5/24	Filament disappeared.	135	N46	6/9	Filament disappeared.
331	N12	5/24	Small filament disappeared.	122	N37	OMP 6/12	Filament intermittently visible during disk passage.
329	N33	6/3	Birth of active region at west limb.	118	N23	6/11	Significant growth of plage and spots near an existing large sunspot.
327	S22	5/28	Birth of tiny active region.	95	N25	6/12 6/17	Large filament partially disappeared. Filament redeveloped at N15.
325	S31	5/25	Faint filament disappeared.	64	N28	6/18	Filament disappeared.
322	N25	5/24	Birth of large active region at position of filament visible on 23 May. This coordinate also marks remnant plage of a great active region visible 2 solar rotations earlier. New region reached maximum on 27 May as a class E spot group.	55	N25	6/16	Filament disappeared in response to region developing nearby.
307	N05	5/25 5/27	Birth of active region. Reached maximum as a class B sunspot group.	54	N19	6/15	Birth of region that developed follower-dominant class D group by 18 June.
284	N21	6/4	Birth of small active region. Growth continued during west limb passage 6 June.	46	S20	6/17-18	Filament was present these 2 days only.
280	N50	5/28-29 6/1	Filament disappeared. Filament reformed.	45	N27	6/20	Filament reformed.
	N28	6/3	Filament disappeared.	43	S24	6/16	Birth of small active region.
270	S55 N25	5/31 6/3	Filament began to form. Birth of small active region, reached peak growth by 5 June.	26	S25	6/26	Birth of tiny region near west limb.
256	N32	5/31	Small active region formed within a faint scattered plage.				
		6/1	Reached maximum as class D spot group.				
252	S12	6/2	Birth of very small region.				
249	N25	5/31	Filament disappeared.				
245	N32	5/30	Birth of small active region that reached maximum by 1 June.				
242	N55	5/29-31	Filament was exceptionally large near east limb.				
240	N14	6/4	Filament began developing within faint region. It reached its maximum on 7 June.				
220	N37	6/4	Filament disappeared.				
210-235	N21	6/5	Significant growth of filament fragments.				
203	N45	6/5	Filament disappeared.				

Note: There were no days without H-alpha photographs.

# H<sub>α</sub> SYNOPTIC CHART

1966 - ROTATION 1508

# H $\alpha$ SYNOPSIS CHART 1966 - Rotation 1509

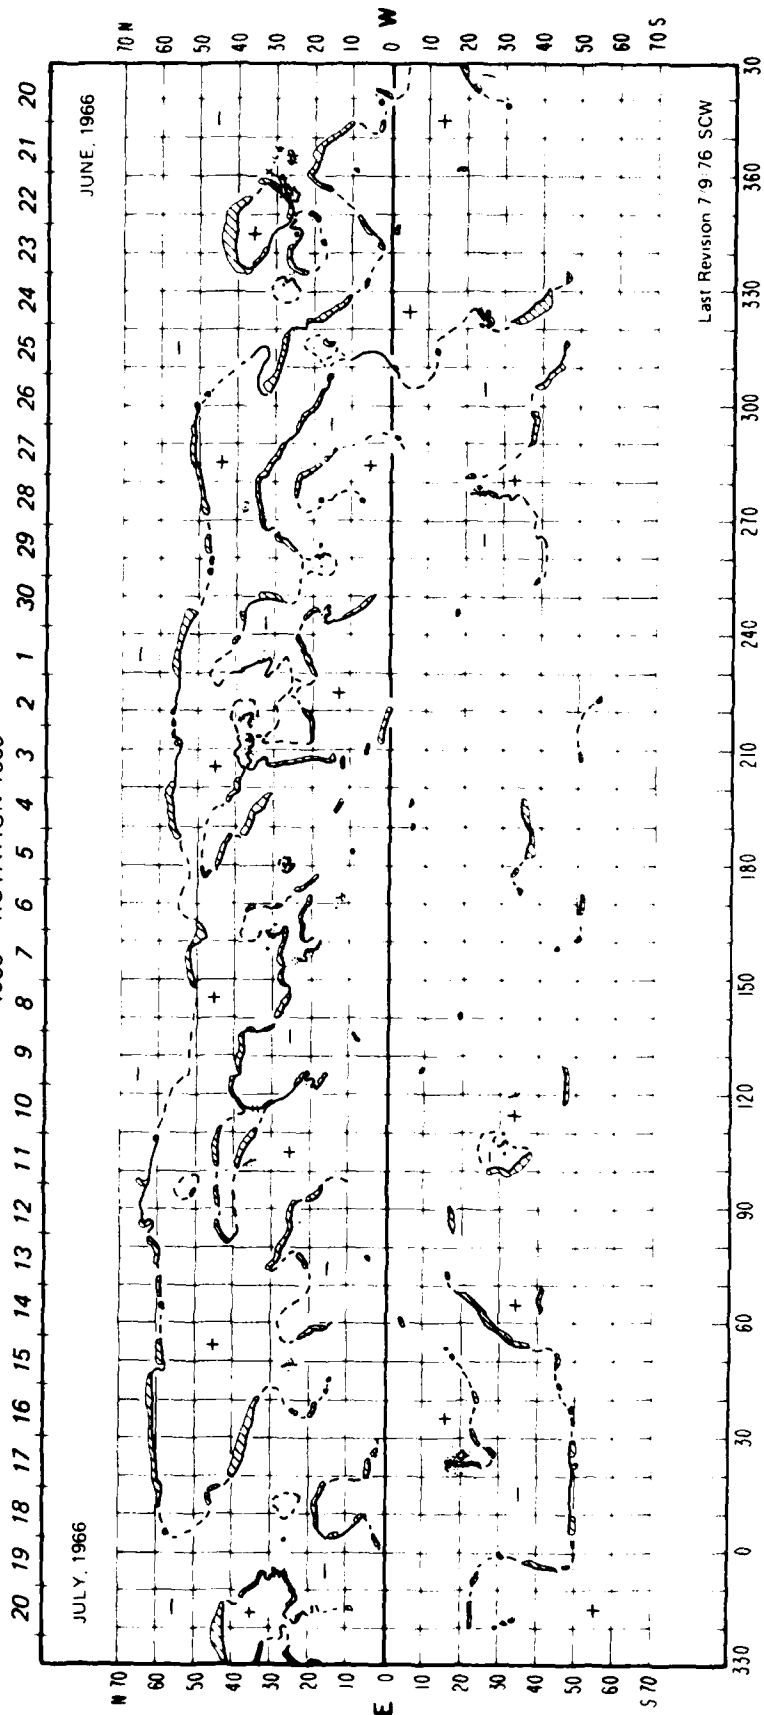

*Long	*Lat.	Date	Descriptive Notes	*Long	*Lat.	Date	Descriptive Notes
357	N30	6/24	Filament disappeared as region developed nearby.	246	N07	7/3	Large filament developed south of active region.
356	N26	6/23	Birth of active region, which reached maximum by 25 June with numerous small spots.	235	N22	7/5	Filament disappeared.
348	N35	6/22	All filaments bordering circular cell of positive polarity disappeared, in apparent response to nearby developing active region.	210	N34	6/30	Filament slowly disappeared.
345	N05	6/22	Faint filament disappeared.				Birth of proton-flare active region studied under the International Proton Flare Project (flare of 7 July 1966).
340	N23	6/23	Birth of new region within follower plume of old active region with K $\alpha$ leader spot. Old spot decayed more rapidly as new spots grew. New group did not exceed class B.			7/3	Birth of second principal bipolar region to east of first; merger of the two created the complex disk spot group with classic delta configuration and east-west neutral line.
338	N26	6/23	Filament disappeared gradually within old active region, as new growth of spots and plage began nearby.			7/7	First major proton flare and probable peak in spot development. Both growth and decay occurred after this date.
332	N28	6/20	Birth of active region, which grew to class D spot group by 22 June.	206	N25	7/2	Filament almost complete, otherwise highly variable.
326	S24	6/26	Birth of small active region, which reached maximum next day as small class C group.	200	N39	6/29	Filament disappeared.
325	S38	6/22-23	Filament disappeared south of developing region.			7/6	Filament reappeared for 1 day.
324	N14	6/26-27	Filament disappeared.	179	N26	7/7	Birth of small active region.
323	S25	6/22	Birth of small active region, which grew to maximum by 26 June as class D spot group. Notable for increasingly negative inclination of group axis as region approached west limb. Follower spot was at lower latitude than leader.			7/10-11	Additional growth at west limb passage.
		6/29-30	New plage growth at west limb passage.	172	N11	7/7	Birth of tiny region, which disappeared by 10 July.
300	S38	6/28	Filaments formed along this neutral line.	164	N22	7/3	Filament disappeared.
290	N28	6/23	Filament disappeared; intermittently and partially reformed during remainder of disk passage.	161	N30	7/6	Birth of moderate active region, which attained maximum as a class D group by 9 July.
285	N18	6/24	Filament disappeared.	155	N24	7/11	Birth of small active region, which was still growing at west limb on 13 July.
263	N26	6/29	Birth of tiny plage, which had nearly disappeared by 2 July.	153	N27	7/1	Filament disappeared.
261	N18	7/4	Minor new growth of plage just before west limb passage.	150-240	N55	7/4	Entire northern polar-crown filament disappeared on day when great proton-flare region began most rapid growth at the longitude centered on the filament.
248	N30	7/3	Filament disappeared.	122	N20	7/7	Birth of active region within old filament channel remaining from great active region that crossed the central meridian on 21 March 1966.
246	N17	7/5	Filament disappeared again.			7/9	Peak development as class B group.
		6/29	New growth within faint old plage resulted in distinctive new convulsion of neutral line through the region. It had an east-west orientation where the plage was brightest. An unusual spot group developed with most of the small spots within a small penumbra that spanned the magnetic neutral line.	120	S33	7/7	Minor new growth within the faint and decayed plage.
		7/1-2	Spot and plage decay.	116	N35	7/7	Birth of tiny region, which disappeared by 9 July.
		7/3	New spot and plage growth.	107	S31	7/10	Filament disappeared.
		7/5	Distinct region decay at west limb.	103	N33	7/15	Birth of moderate active region, which attained maximum next day as small class C spot group.
				85	N25	7/12	Birth of small active region, which was still growing at west limb on 17 July.
				49	N25	7/16	Filament disappeared.
				24	N04	7/14	Birth of small active region.
				14	N23	7/14	Filament disappeared.
							Birth of small active region, which remained bright until 21 July.

Note: Days without H-alpha photographs were 26 and 27 June 1966.

# H<sub>α</sub> SYNOPTIC CHART

1966 - ROTATION 1509

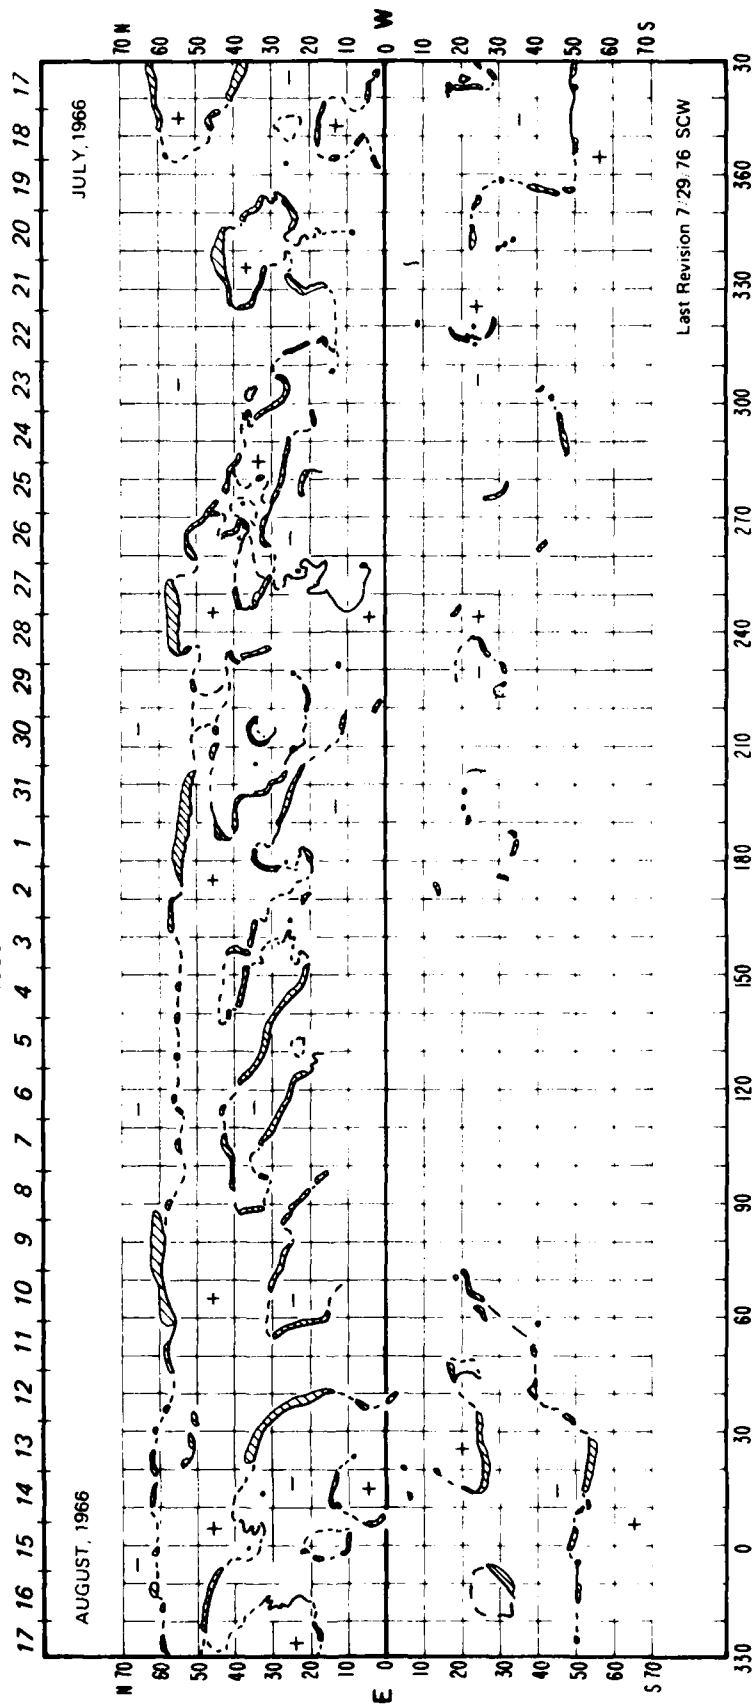

# H $\alpha$ SYNOPTIC CHART 1966 - Rotation 1510

*Long.	*Lat.	Date	Descriptive Notes	*Long.	*Lat.	Date	Descriptive Notes
356	S40	7/22	Filament disappeared.	187	N52	7/29	Filament disappeared.
344	N20	7/19	Birth of small active region.	178	N10	8/3	Filament disappeared within bright plage. Active region to south had peculiar spot group with "delta" configuration. Region decayed more rapidly after this date.
340	N43	7/23	Filament disappeared.	170	N22	7/27-8/1	Plage area with very active absorption feature visible this period only.
336	S07	7/21	Birth of small active region.	159	N26	7/28	Birth of unusual active region on this or previous day at east limb. Rapid relative motions among the spots, which reached maximum 31 July as a small class E group.
314	N24	7/20	Birth of small active region.	155	N38	8/3	Complex system of filaments formed and continued their development to west limb.
303	N36	7/24	Birth of small active region, apparently associated with filament disappearance south of this location.	133	N22	8/1	Birth of peculiar small region near another existing small region with which it merged. Spot group never exceeded class B, but showed rapid variations in count from day-to-day.
302	N25	7/24	Curved filament disappeared.	92	N21	8/5	Filament disappeared, but re-formed next day.
300	N37	7/20	Rapid disappearance of plage.	45	S22	8/13	Birth of active region near site of small region, which had disappeared by this date. New region may have reached its peak size on 15 August as a small class C spot group.
285	N20	7/29	Birth of tiny active region near remnants of earlier small region.	5	N35	8/10	Birth of active region that had unusual amount of divergence between leader and follower spots. The follower apparently shared the rotation rate of high latitude features that merged with low latitude features east of this region after this region formed. Reached maximum on 13-14 August as class E spot group.
282	N20	7/23	Birth of small active region near southern end of filament, which disappeared same day.				
278	N28	7/23	Filament disappeared in apparent response to regions developing at both its ends.				
275	N44	7/24	Filament disappeared in apparent response to developing region south of this location.				
269	N38	7/21	Birth of moderate active region that grew to maximum by 25 July as class E spot group. Growth of region apparently led to filament disappearances adjacent to the region and facilitated major rearrangement of large-scale magnetic fields.				
265	N52	7/28	Filament disappeared.				
234	N35	7/27	Filament disappeared.				
223	S30	7/27	Birth of tiny active region.				
213	N12	8/3	Birth of tiny plage.				
209	N25	8/3	Birth of small active region.				
203	S24	8/2	Birth of small active region.				
197	N35	7/28	Major flare occurred in extended faint plage that was the return of the great proton-flare region of July. Nearby filament disappeared by next day. Eastward motion of this region led to convergence with large-scale L $\alpha$ features to the east and south. Formation of important new active regions on this and the next solar rotation might be a consequence of this convergence.				

Note: There were no days without H $\alpha$ -alpha photographs.

# H<sub>α</sub> SYNOPTIC CHART

1966 - ROTATION 1510

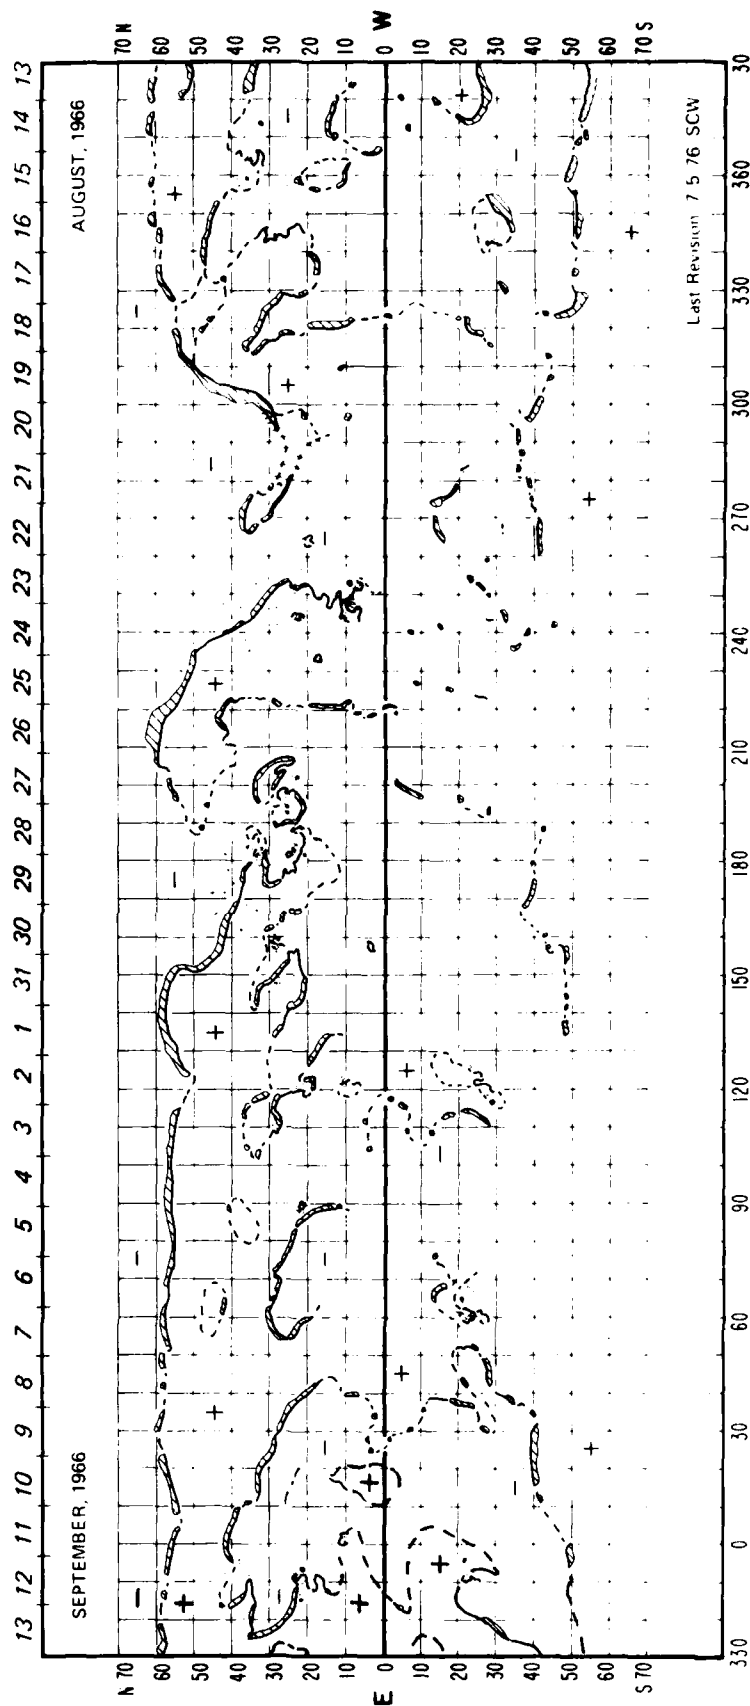

# H $\alpha$ SYNOPTIC CHART 1966 - Rotation 1511

*Long.	*Lat.	Date	Descriptive Notes	*Long.	*Lat.	Date	Descriptive Notes
358	N27	8/11-12	Region of faint plage devoid of spots developed and expanded during remainder of disk passage. This example indicates that magnetic flux does emerge in addition to flux within active spotted regions. Filament disappeared.	182	N23	8/22	East limb passage of peculiar sunspot group that may have formed just the previous day. Umbrae within the small round penumbra rotated in counterclockwise manner about some common center during the first half of the disk passage.
350	S30	8/17	Formation of filament in apparent response to nearby developing region.	8/27-28			Apparent acceleration of relative spot motions and rapid growth of new spots and penumbra south of the original spots. Class 38 proton flare occurred at about 1530 UT on 28 August; the subject of numerous detailed reports as part of the Proton Flare Project. Note (1) that the remnant plage and sunspot from the proton flare region of 2 rotations earlier had drifted eastward so that these two regions shared the same solar longitude at the time of peak activity, and (2) that the older spot disappeared near the time of peak activity in the new region.
345	N47	8/13	Filament disappeared in response to nearby developing region. Re-formed 15 August.	8/28-9/2			Spots grew and darkened until date of second and stronger of the two proton flares in this region.
342	S29	8/13	Birth of small active region.	9/4	N28	9/4	Birth of small active region that was still growing at west limb passage on 6 September. A significant region was at this location on the next solar rotation.
320	N15	8/15	Filament disappeared as region formed at northern end.	150	N28	9/2	Filament within faint plage disappeared.
316	N30	8/15	Birth of small active region, which had disappeared next day.	145	N21	8/31	Filament disappeared.
305	N40	8/23	Filament became exceptionally large during last 3 days of disk passage.	122	N10	8/31	Birth of tiny active region.
283	S21	8/18	Birth of tiny active region that disappeared next day.	120	N20	8/28	Birth of small region under small filament.
272	N34	8/26	Semicircular filament disappeared.	8/29			Filament disappeared over growing plage.
264	N20	8/24	Birth of small active region.	115	N28	9/3	Filament disappeared.
248	N09	8/23	Birth of important active region, which emerged on a major preexisting north-south neutral line. Growth continued until 28 August; when near west limb, it had developed into a class E spot group. The leader sunspot became exceptionally large and dark and returned for 5 additional solar rotations, becoming the londest lived sunspot of this solar cycle.	9/6			Filament re-formed by this date.
				9/7			Filament disappeared.
223	S25	8/24	Birth of tiny active region.	60	S22	9/4	Birth of active region that grew slowly for first few days of its life.
220	N55	8/23-24	Gradual disappearance of filament.	9/9			Rapid growth of spots and plage.
199	S05	8/24	Filament disappeared.	52	S23	9/5	Birth of active region, which also grew slowly for first few days.
197	N25	8/22	Birth of moderate active region that attained maximum as a class D spot group 23-24 August. Rapid dissolution of this group thereafter was accompanied by rapid growth of a major proton-flare region immediately east of its position.	9/9			Rapid growth of spots and merger with region immediately to west. Peak development for this complex occurred 10 September.
		9/1	Disappearance of spots occurred simultaneously with the disappearance of spot north of the nearby proton-flare region.	38	S10	9/10	Minor growth of plage and first sunspots within faint region that was visible previous 7 days.
				2	N10	9/12	Birth of small active region.

Note: Days without H-alpha photographs were 19 and 22 August 1966.

1966 - Rotation 1514

*Long.	*Lat.	Date	Descriptive Notes	*Long.	*Lat.	Date	Descriptive Notes
353	M24	11/5	Filament disappeared within faint plage.	125	S18	11/25-26	Filament disappeared.
335	N38	11/6	Large filament disappeared.	110	S45	11/22-23	Filament disappeared.
296	M18	11/5	Birth of small active region, which reached largest size next day as class B spot group.	97	M25	11/27	Birth of moderate active region where filament and faint plage existed before. Became class D spot group next day.
		11/6-7	Group blended with larger new active region directly north of its location.				
294	M23	11/6	Birth of active region, which grew to class C by 8 November and blended with older region south of its position.	62	N33	11/28	Filament disappeared.
292	M14	11/9	Birth of moderate active region, which grew to a large class C spot group by 12 November.	34	M14	12/4	Birth of small, new region within remnant leader-polarity plage of region born 23 November. Growth may have continued to west limb passage 6 December.
270	M36	11/8	Large filament disappeared.				
255	M12	11/11	Formation of new bipolar plage and spot group between 2 large old leader sunspots.	33	M17	11/23	Probable date of birth of moderate active region at east limb. Attained maximum 25 November as class D follower-dominant spot group.
253	M17	11/10	Formation of new spots and plage on northern edge of old leader sunspot.	30	S20	12/4	Birth of tiny active region.
253	M07	11/13	Important growth of new plage and spots near eastern edge of large spot, which had returned 6 November for its fourth solar rotation.	5	N26	11/28	Birth of small active region.
		11/18	Maximum size of spots and penumbra in complex configuration.				
226	M27	11/13	Formation of large filament.				
		11/20-21	Filament disappeared near west limb.				
225	M43	11/14	Filament disappeared gradually.				
209	M14	11/19	Birth of small active region.				
205	M24	11/12	Filament disappeared near east limb.				
175	S18	11/20	Birth of small active region.				
165	M19	11/14	Birth of active region at east limb, which grew to maximum 18 November as class C spot group.				
		11/19	Began more rapid dissolution, as strong new region developed immediately east of this location.				
150	M21	11/19	Birth of major active region, which grew to complex class D spot group by 22 November. It emerged on major north-south neutral line that was continuous to the northern polar crown.				
145	S27	11/22-23	Large semicircular filament disappeared.				
135	N38	11/18	Large filament disappeared near east limb.				

Note: Days without H-alpha photographs were 7, 22-23 and 25 November 1966.

H $\alpha$  SYNOPTIC CHART  
1966-1967 - Rotation 1516

*Long.	*Lat.	Date	Descriptive Notes	*Long.	*Lat.	Date	Descriptive Notes
355	N22	12/31	Semicircular filament within faint plage disappeared.	69	N11	1/18	Birth of moderate active region that grew to maximum as a small class D spot group.
318	S22	12/29	Birth of large active region that reached class E spot group by 3 January. Developed large dark surges extending west of the very large leader spot.	42	N23	1/22	Plage near neutral line brightened, perhaps coinciding with rearrangement of neutral lines to include large region to south.
316	N16	1/2	Birth of region that attained class D spot group by 3 January.	N17	1/22	1/22	CMP of peculiar follower-dominant class D spot group, which was past maximum development when first observed at east limb on 16 January. Developed numerous additional spots when near central meridian. Appeared to be blend of two active areas closely spaced in latitude.
300	N60	1/7-8	Polar crown filament disappeared.	41	S18	1/20	Birth of small active region on following border of large, faint plage.
280	N23	1/7-8	Filament disappeared.	17	N14	1/20	Birth of active region near east limb, between two existing regions. These three regions blended to form one of the first major activity complexes of Solar Cycle 20. Maximum sunspot development 27 January after an irregular trend of growth.
263	S19	1/2	Birth of active region on leading border of large faint plage. Grew to maximum as large class D spot group by 6 January.	14	N02	1/26	Birth of tiny active region.
261	N19	1/2	Birth of active region that developed class D spot group by 3 January.	12	N22	1/22	Birth of active region on northern border of activity complex. Irregular growth to maximum by 28 January as class D spot group that blended with group of similar scale south of this location.
255	N09	1/2	Filament on eastern border of small active region disappeared near east limb.	11	S20	1/27	Portion of filament disappeared within faint plage.
245	S28	1/11	Large filament disappeared from within faint, extensive plage.	10	N02	1/25	Birth of tiny active region.
240	N13	1/8	Birth of active region on leading border of small region that formed 3 days earlier. Grew to maximum as large class D spot group by 11 January.	3	S20	1/21	Birth of very small active region near east limb.
232	N14	1/5	Birth of small active region.				
219	N24	1/5	Birth of major active region that grew to maximum by 10 January as large class D spot group.				
192	N16	1/10	Birth of active region that grew to maximum as class C spot group by 14 January. Leader spot continued to develop through west limb passage 17 January. Returned next rotation as very large spot.				
155	N49	1/12	Large filament disappeared.				
132	S24	1/10	Birth of major active region near east limb. Grew to maximum size as class E spot group by 14 January.				
115	N34	1/14	Portion of large filament disappeared, in apparent response to developing active region southeast of this location.				
		1/20	Filament re-formed.				
107	N23	1/12	Probable date of birth of active region at east limb that grew to class C spot group by 15 January.				
95	N20	1/21	Birth of small active region.				

Note: Days without H-alpha photographs were 4, 5 and 7 January 1967.

# H<sub>α</sub> SYNOPTIC CHART 1967-ROTATION 1516

H $\alpha$  SYNOPTIC CHART  
1967 - Rotation 1517

"Long.	"Lat.	Date	Descriptive Notes	"Long.	"Lat.	Date	Descriptive Notes
353	S22	1/27	Birth of small active region.	130	N49	2/13	Portion of large filament disappeared directly north of developing filament within large old plage.
349	N40	1/30	Filament disappeared.	122	N21	2/14	Large S-shaped filament disappeared within large extensive plage. Eruption occurred at 1747 UT previous day, preceding one of the largest H-alpha flares (in area) during this solar cycle. Sunspots were very small or absent on flare day in a region that had been declining since east limb passage. This filament, and filaments north of the active region, were active for several days before the flare.
339	N28	1/29	Filament disappeared, possibly related to filament disappearance on same neutral line to north on 30 January.				
315	S54	2/1	Large southern polar crown filament disappeared same day as similar filament disappearance along northern polar crown.	110	N12	2/10	Filament disappeared.
300	N31	1/28	Filament disappeared; reappeared 30 January.	109	N15	2/13	Birth of new plage and spots in leading portion of existing active region. New spots grew to class D spot group by 16 February.
271	N13	1/28	Probable date of birth of active region near east limb. Maximum development by 1 February as class C spot group.	79	N13	2/10	Probable date of birth of small active region at east limb. Maximum development by 12 February as small class C spot group.
263	N23	2/2	Filament disappeared that had been associated with extensive area of faint plage.	65	S52 N25	2/17 2/20-21	Filament disappeared. Filament disappeared; had been highly variable for previous 5 days.
258	N47	2/1	Large filament disappeared almost the same time as similar filament disappearance near south pole.	62	S30	2/16	Filament present this day only.
248	N23	2/5	Filament disappeared from within extensive area of faint plage.	59	N15	2/19	Birth of small active region.
246	S20	2/1	Birth of small active region near large filament. A portion of the filament disappeared 3 February as the neutral line incorporated this new active region	55	S03	CMP 2/18	Filament intermittently present and especially active.
220	S22	2/5	Semicircular filament disappeared; associated with large, single sunspot.	46	N18	2/18	Filament disappeared from within large area of faint plage.
216	S14	2/2	Birth of small active region.	41	S18	2/21	Birth of very small active region.
192	N14	2/6	Birth of important active region on existing neutral line of large old region with great leader sunspot. Rapid decay of the old spot accompanied growth of new spots. Maximum development of new region by 9 February as class D spot group.	23	S30	2/24	Semicircular filament disappeared from within small faint plage. Re-formed next day.
175	S35 N20	2/5 2/12	Filament disappeared near east limb. Great filament disappeared near west limb.	13	N16	2/19	Filament disappeared; associated with large, old active region.
171	N19	2/3	Probable date of birth of significant active region at east limb. Grew to class E spot group by 7 February.	8	S26	2/27	Birth of small active region near west limb.
165	N63	2/9	Polar crown filament disappeared.	3	S25	2/19	Portion of filament disappeared.
162	N28	2/6	Birth of small active region.				
152	N25	2/6	Filament disappeared at east limb; re-formed 8 February.				

Note: Day without H-alpha. photographs was 20 February 1967.

# H $\alpha$ SYNOPTIC CHART 1967 - Rotation 1518

Long.	Lat.	Date	Descriptive Notes	Long.	Lat.	Date	Descriptive Notes
340	N19	2/20-21	Birth of small active region.	97	N25	3/11-12	Small circular filament disappeared.
310	S21	2/26	CMP of symmetric sunspot surrounded by marked vortical structure with a clockwise sense of twist.	88	N29	3/10	Birth of small active region near east limb.
300	N22	2/25	Peak development of giant class F spot group that extended approximately 20° in longitude. This was the largest spot group since 1960.	84	N19	3/10	Birth of small active region near east limb.
290	S10	2/	Birth of small active region.	78	N28	3/13	Birth of small active region that grew to class C spot group on 15 March.
276	S19	2/26	Birth of small active region.	55	N51	3/18	Filament disappeared.
270	N05	2/26-27	Filament disappeared, in apparent response to growth of active region north of this location.	46	N18	3/16	Birth of small active region with unusually slow growth. Small class B spot group persisted for almost all of disk passage.
265	N15	2/27	Birth of active region that grew to maximum 2 March as large, simple class E spot group.	45	S17	3/15	Growth of new spots near center of small class E spot group created complex region with high spot count. Maximum development by 17 March.
264	S14	2/26	Birth of small active region.			3/22	Additional spots and plage formed at following end of region.
246	S27	2/27	Birth of small active region.	8	S15	3/21	CMP of filament that was especially active.
240	S03	3/3	CMP of filament that was very active and intermittently visible throughout disk passage.				
222	S21	3/3	Peak development of class E spot group that displayed complex, rapid evolution. Associated filaments complex and active.				
216	N15	3/1	Birth of active region in northern portion of old plage that consisted of two regions with declining small spots groups. New spots grew to maximum 4 March as small class E spot group.				
215	S45	2/28	Large filament disappeared at east limb.				
165	S49	3/14	Filament disappeared near west limb.				
162	S20	3/6	Peak development of class D spot group with large spot count, with penumbra encompassing entire group, and with group axis inclined to the solar equator at an unusually large angle.				
150	N39	3/9	Almost all of large filament disappeared.				
145	S35	3/12	Several filaments disappeared, in apparent response to rearrangement of neutral lines.				
120	N28	3/15	Filament disappeared.				
	N24	3/17	Birth of small active region near west limb.				
104	S24	3/10	Birth of small active region.				
		3/14	Small filaments that were associated with this plage disappeared.				

Note: Days without H-alpha photographs were 26 February and 11 March 1967.

*Long.	*Lat.	Date	Descriptive Notes	*Long.	*Lat.	Date	Descriptive Notes
347	N20	3/20	Birth of small active region north of and near follower spot of old, small class E spot group.	10	S10	CMP 4/17	Filament very active. Proper motion to northwest during disk passage.
334	N12	3/21	Birth of small active region.	3	S21	4/16	Birth of active region with little growth during first 5 days.
298	S22	3/27	Birth of major active region with rapid growth to class E spot group. Reached maximum 30 March.			4/19	Beginning of more rapid growth with maximum on 22 April as class C spot group.
285	N20	3/21	Probable date of birth of major active region in trailing portion of a great plage that had returned for its second disk transit. New spots attained maximum as class E on 30 March. Important growth and spot motions evident each day of disk passage.				
206	S19	4/2	Birth of small active region.				
205	N36	4/3	Birth of small active region.				
172	S21	4/8	Birth of small active region.				
158	S20	4/6	Birth of active region that grew to class E by 10 April. Neutral line pattern in vicinity greatly altered by region's growth.				
144	N15	4/7	Filament disappeared.				
130	S25	4/4	Birth of active region. Maximum development occurred next day as class C spot group with high spot count.				
113	S21	4/5	Birth of small active region.				
110	N12	4/13	Birth of active region that was still growing during west limb passage on 15 April. By 15 April it had attained a class D spot classification.				
109	N23	4/7	Birth of active region with maximum development on 11 April as class D spot group.				
78	N17	4/10	Part of filament disappeared.				
65	N37	4/9	Filament disappeared at east limb.				
55	N16	4/17	Birth of new region at position of small spot that had appeared at east limb on 8 April and that had disappeared by 16 April. New spots never exceeded class B.				
45	S30	4/9	Filament disappeared near east limb.				
20	S37	4/12	Filament disappeared at east limb.				
	N12	4/19	Filament disappeared after exhibiting great activity for previous 7 days.				

Note: Days without H-alpha photographs were 26 and 29-31 March and 11 April 1967.

# H<sub>α</sub> SYNOPTIC CHART

1967 - ROTATION 1519

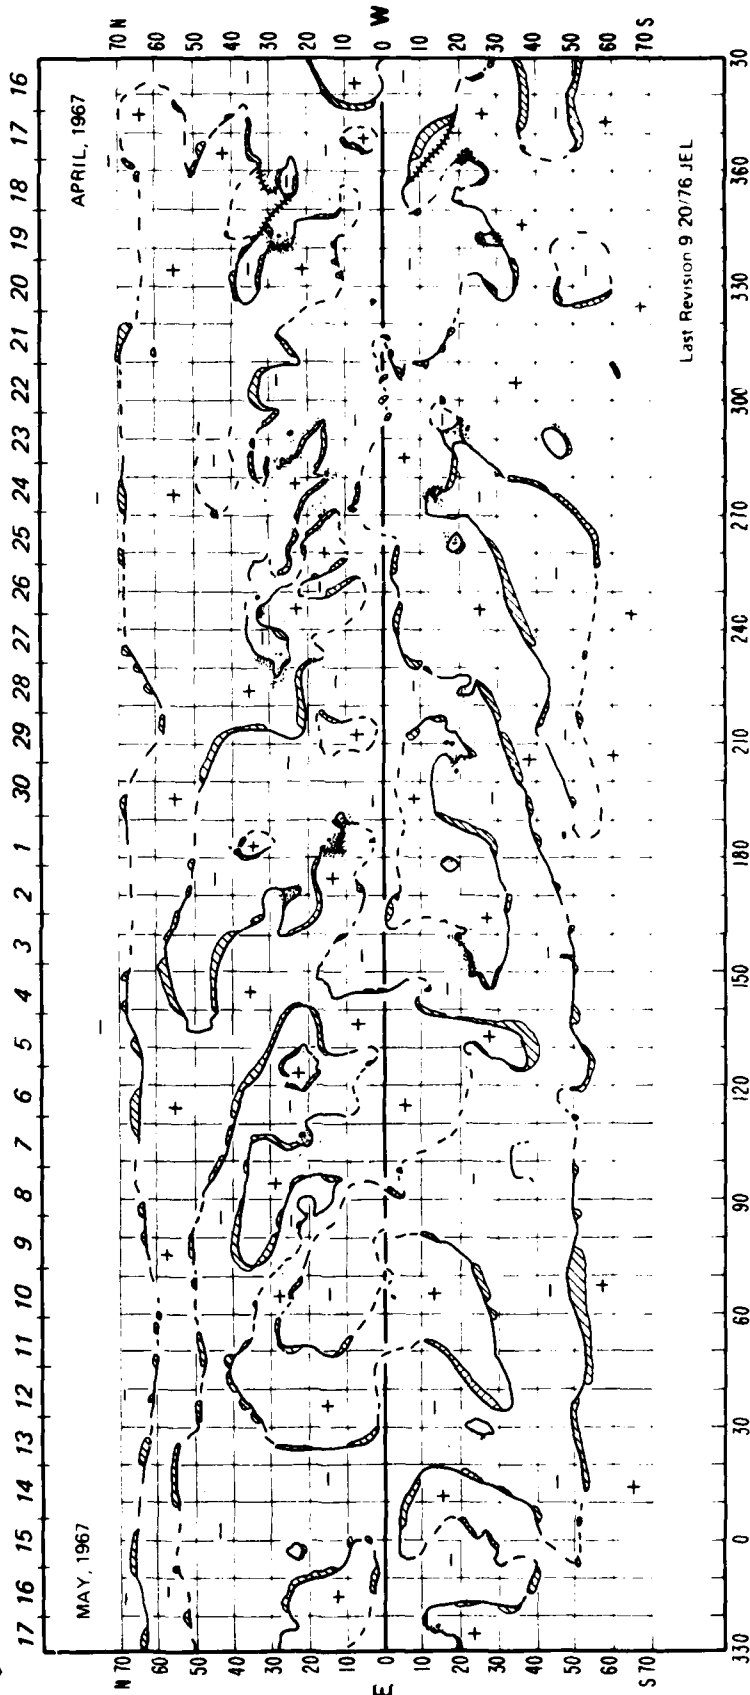

# H $\alpha$ SYNOPTIC CHART 1967 - Rotation 1520

*Long.	*Lat.	Date	Descriptive Notes	*Long.	*Lat.	Date	Descriptive Notes
342	N28	OMP 4/19	Active region appeared at east limb 13 April with almost all of plage in following portion of region and with neutral line curved concentric to a large leader sunspot. The plage nearly disappeared by west limb passage, although the leader sunspot remained. This spot had an unusually slow rate of solar rotation for its latitude, shifting 16° to the east by rotation 1521. The associated large-scale neutral-line pattern continued this rate of motion into rotation 1522.	137	S25	5/8	Large curved filament disappeared.
	S26	4/23	Birth of small active region.	135	N17	4/30	Filament disappeared near east limb.
295	N39	4/21	Large filament disappeared as neutral-line pattern north of aged active center simplified.	130	N30	5/4	Filament disappeared.
293	S45	4/21	Birth of small active region.	104	N27	5/9	Large filament disappeared near large, symmetric sunspot.
275	S45	4/24	Large filament disappeared in apparent response to slowly growing active region west of this location.	65	S49	5/9	Large filament disappeared.
264	S19	4/22	Birth of small active region.	43	S20	5/11	Large filament disappeared within extensive faint plaque.
252	S32	4/29	Large filament disappeared.	25	S50	5/14	Filament disappeared.
246	N33	4/27	Birth of small active region.	24	N10	5/14	Filament disappeared.
230	N28	4/24	Birth of new plage and spots in following portion of existing small spotted region. Older spots quickly decayed as new spots developed. Maximum development occurred on 27-28 April as class D spot group with irregular penumbrae containing mixed polarities. Spots and plage had disappeared before west limb passage on 3 May. This location generated a great activity complex by the time it returned to east limb 2 weeks later.				
212	S22	5/1	Birth of small active region.				
205	S18	4/24 4/27	Birth of active region at east limb. Beginning of rapid growth to maximum next day as class D spot group.				
190	N09	5/4	Birth of small region on southwest border of active region.				
187	S22	4/30	Partial disappearance of large filament.				
183	N13	4/29 5/2	Beginning of growth within small faint plage. Maximum development as simple, class D spot group.				
180	S17	5/6	Birth of small active region.				
165	N18	5/5	Filament disappeared.				
154	N43	5/5	Filament disappeared.				

Note: Days without H-alpha photographs were 16 and 17 May 1967.

# H<sub>α</sub> SYNOPTIC CHART

1967 - ROTATION 1520

Last Revision 9 20/76 JEL

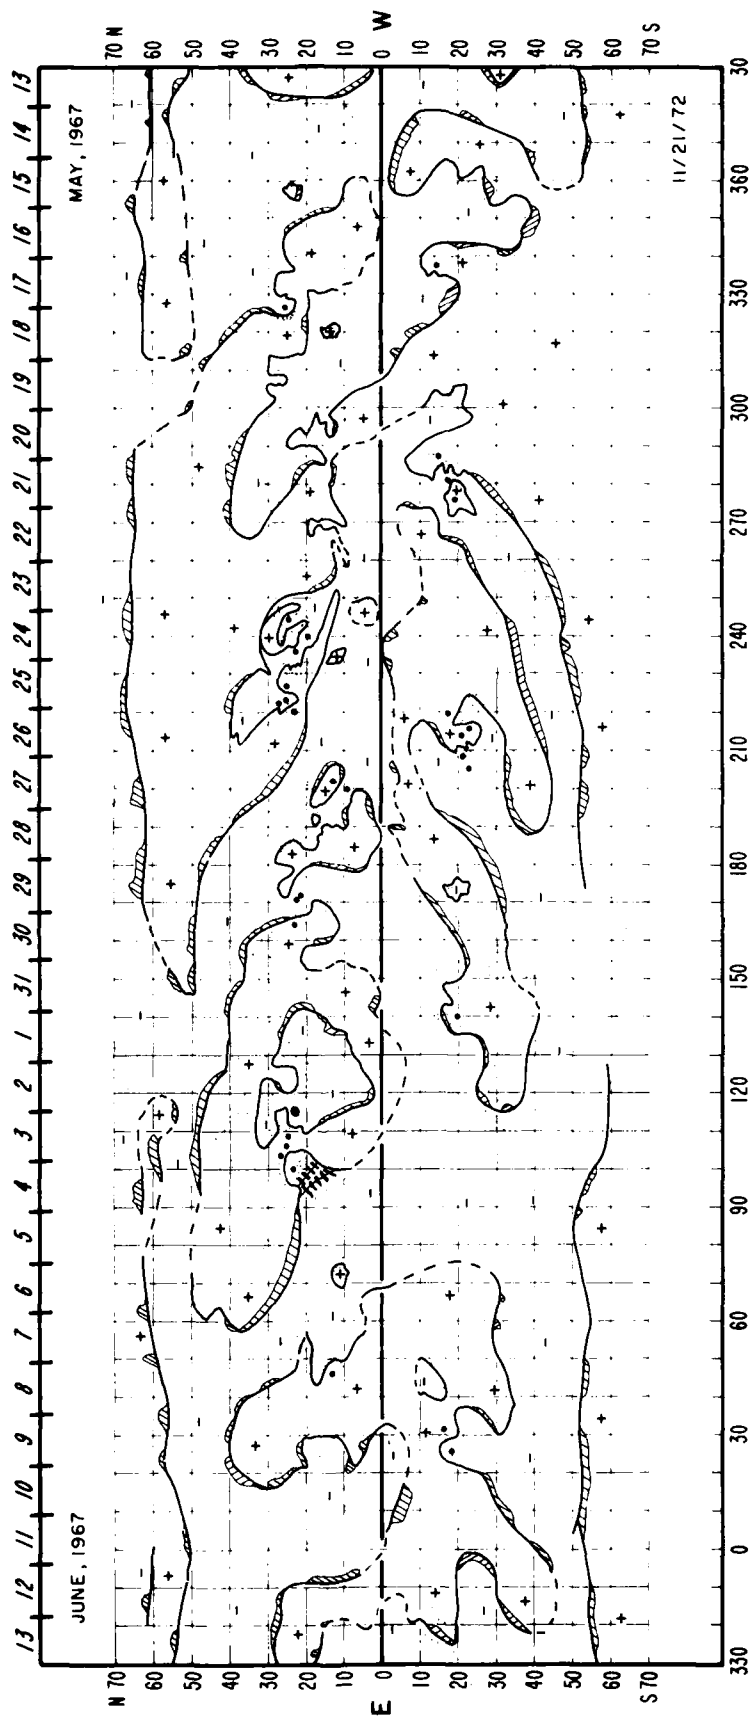

# H<sub>α</sub> SYNOPSIS CHART 1967 - Rotation 1521

°Long.	°Lat.	Date	Descriptive Notes	°Long.	°Lat.	Date	Descriptive Notes
335	S14	5/12	Birth of active region near east limb.	227	N37	5/20	Filament disappeared near east limb with resultant chromospheric brightening; re-formed next day.
326	N26	5/18	CMP of single, large sunspot with large-scale neutral line closely concentric to the spot. Rotation rate for this spot abnormally slow for its latitude (moved 16° east in one rotation) as if the passage of slowly-rotating large-scale features north of this position affected the spot. See similar patterns, evolutionary sequence, and relationship between sunspot and high-latitude features occurred in 1971 during rotations 1569-1571 at (300, N20).	223	S25	5/24	Intensification of leading portion of old, faint plage with the appearance of small spots on the next day only.
278	S18	5/19	Birth of small active region.	211	S22	5/24	Birth of active region on trailing border of old plage; maximum development on 27 May as class D spot group.
263	S21	5/21	Birth of active region at trailing boundary of older region; attained class D spot group by next day. Additional growth of numerous small spots.	200	N13	5/23	Birth of active region near east limb and close to northern edge of large single spot. Slow growth to maximum on 28 May as class D spot group.
252	S44	5/21	Filament disappeared in apparent response to growth of nearby active region.	179	N10	5/25	Dark, circular filament developed around leading portion of the (200, N13) region.
250	N04	5/24	Partial disappearance of large filament.	171	N22	5/30	Filament disappeared near east limb.
243	N27	5/25	Birth of small active region.	170	N18	5/24	Leader sunspot divided and components rapidly diverged and decreased in size after this date.
236	N11	5/24	Birth of small active region on northwest border of great activity complex, forming the fifth member of the complex.	145	N39	6/2	Birth of active region near east limb and on southern border of large, mature, active region. New spots reached maximum 27 May as small class D spot group.
235	S01	5/25	Birth of small active region.	126	N25	5/27	Filament disappeared.
232	N24	5/18	CMP of especially active filament.	120	S25	5/29	Probable date of birth at east limb of small active region.
			East limb passage of one of the greatest activity complexes of Solar Cycle 20. Composed of three overlapped spot groups at time of first appearance, two of which were growing.	108	N23	6/3	Filament disappeared at east limb.
		5/20	Birth of fourth spot group on southern border of complex. Westward relative motion of this group, with respect to large spots to the north, may have contributed to conditions for great flare of 21 May in center of complex.				CMP and maximum development of great class F spot group that was composed of three blended, smaller groups. Leader spot became especially large and dark after this date.
		5/21	"Collision" between central and western members of the complex, as growth and expansion of central member moved its leader spot into the follower plage of the western member. Large flare occurred over the neutral line between the groups.	75	N22	6/8	Partial disappearance of large filament.
		5/23	"Collision" and merger of leader of easternmost member with follower of central member, creating large "delta" magnetic configuration. Closest separation between the opposite-polarity spots coincided with great white-light, proton flare at 1840 UT (see IAG Report 6). These spots moved in a rotary pattern with respect to one another during 21-26 May.	74	N11	6/2	Birth of small active region.
		5/28	Additional great flare over the "delta" configuration.	50	N13	6/4	Birth of active region that developed follower-dominant class C spot group by 6 June.
				S12	S12	6/4	Birth of small active region.
				29	S18	6/7	Intensification of small, faint plage and appearance of small spots.
				13	S29	6/9	Second phase of growth, reaching maximum next day as class A spot group.
				11	S05	6/9	Filament disappeared.
							Filament disappeared.

Note: Days without H-alpha photographs were 16-17 May 1967.

# HQ SYNOPSIS CHART 1967 - ROTATION 1521

# H $\alpha$ SYNOPTIC CHART 1967 - Rotation 1522

*Long.	*Lat.	Date	Descriptive Notes	*Long.	*Lat.	Date	Descriptive Notes
352	N15	6/11	Filament disappeared.	62	S21	6/30 7/2	Birth of active region with slow initial growth. Rapid growth, with maximum development by 4 July as class D spot group; contained "delta" magnetic configuration.
336	S15	6/16	Filament disappeared.				
315	N25	6/15	Separation between large-scale areas of positive-polarity at former position of sunspot with abnormally slow rotation rate on previous solar rotations. Evidence for large-scale divergence at this location.	30	N33	7/6	Large filament disappeared as large-scale areas of positive-polarity merged to form great unipolar region observed on next rotation.
309	N33	6/14	Small filament disappeared.	10	N29	7/10	Portion of large filament disappeared.
273	S13	6/16 6/21	Birth of small active region with slow rate of growth. More rapid growth for 1 day, followed by rapid fading.				
271	N27	6/23	Birth of small active region at west limb.				
260	S35	6/21	Large filament disappeared.				
250	N17	6/18 6/24	Birth of small active region. Intensified just before west limb passage.				
198	N11	6/24	CMP and beginning of rapid dissolution of single spot that returned from previous disk transit with virtually no attendant plage.				
190	S17	6/24	Large filament disappeared.				
175	N36	6/23	Large filament disappeared.				
170	N19	6/22	Maximum development of large class D spot group.				
163	S23	6/28	Birth of small active region near western edge of leader spot; no spots appeared.				
156	N32	6/30	Birth of small active region near filament.				
155	S23	6/22	Birth of active region at east limb that grew to maximum by 25 June as simple class D spot group.				
153	N32	7/2	Filament disappeared near west limb, in apparent response to growth of nearby active region.				
142	S19	6/26	Filament disappeared.				
135	N15	7/1 7/2	Birth of small active region in filament channel. Large and active filament developed over the new region.				
95	N26	7/6	Birth of important active region near east limb and in following portion of remnant of great region from previous disk passage. This new region returned next rotation as a large and very active region.				
87	N13	6/29	Birth of small active region.				

Note: Day without H-alpha photographs was 25 June 1967.

Figure 1 is a map showing the evolution of the Hawaiian Islands from July 1967 to June 1967. The map is oriented with North (N) at the top and South (S) at the bottom. The horizontal axis represents time, with dates from July 10, 1967, to June 10, 1967. The vertical axis represents distance in degrees, from 30°N to 30°S. The map shows the progression of the Hawaiian Islands, with labels for 'Major Growth 7 July' and 'Rapid Evolution'.

351	N25	7/3	Birth of small active region at east limb and north of old region.	156	S10	7/20	region next rotation.
		7/7	Second phase of growth with maximum next day as class C spot group.				Birth of small active region.
		7/11	Third phase of minor growth.	150	S32	7/29	Large filament disappeared at west limb from boundary of large, faint plage.
		7/14	Fourth, and more substantial, phase of growth just before west limb passage; became class D spot group.				
335	N30	7/8	Filament disappeared in apparent response to growth of nearby active region; re-formed by 10 July.	99	N27	7/29	CMP and maximum development of a great class F spot group with spot count exceeding 100 and area >1500 millionths of the solar hemisphere.
		7/11	Filament disappeared again.				
321	N21	7/9	Large curved filament disappeared, as neutral lines to its west rearranged to connect new active region with remnant plage. Filament possibly affected by growth of nearby region.	85	N12	7/24	Maximum development of open class E spot group.
320	N53	7/9	Filament disappeared near east limb.	69	N17	7/26	Birth of active region that reached class D by 29 July. Flares occurred on neutral line separating this region from the large class E spot group to its west.
313	N25	7/7	Birth of small active region near east limb.				
296	N27	7/11	Birth of small active region.	50	N30	8/6	Curved filament disappeared near west limb.
287	N39	7/12	Small filament disappeared in apparent response to growth of small, nearby active region.	46	N22	8/1	Neutral lines rearranged to incorporate isolated active-region neutral line into the large-scale pattern west of the region.
282	S12	7/12	Filament disappeared in apparent response to growth of nearby active region.	27	S30	8/1	Birth of active region. Reached maximum 5 August as class D spot group with negative slope to spot group axis, i.e., with leader spot at higher latitude than follower.
278	S13	7/10	Birth of small active region near east limb.				
268	S27	7/16	Filament disappeared in apparent response to growth of nearby active region.	25	S21	7/29	Birth of active region.
265	S21	7/10	Birth of active region at east limb that reached maximum 17 July as class B spot group.	10	N30	8/2 8/4	Partial disappearance of large filament. After this date filament re-formed and became especially large for rest of disk passage.
255	N07	7/15	Birth of tiny active region.				
248	S18	7/11	Birth at east limb of active region that reached maximum 15 July as class D spot group.				
225	S06	7/17-18	Filament disappeared.				
208	N34	7/20	Rearrangement of neutral lines isolated negative-polarity cell from large-scale neutral line to its west. This area was the remnant of the great activity complex of rotation 1521.				
207	N22	7/18	Partial disappearance of filament.				
177	S32	7/17	Birth of active region near east limb and in filament channel. Became small class D spot group by 20 July.				
170	S30	7/28	Birth of active region at west limb; returned as large				

Note: Days without H-alpha photographs were 13 and 31 July 1967.

# H $\alpha$ SYNOPTIC CHART 1967 - Rotation 1524

*Long.	*Lat.	Date	Descriptive Notes	*Long.	*Lat.	Date	Descriptive Notes
357	N39	8/4	Birth of tiny active region near large filament.	145	N13	8/21	Birth of small active region and small filament west of it. Filament and region disappeared next day.
342	S35	8/10	Filament disappeared near west limb.	140	N24	8/18	Filament on lower border of large-scale cell disappeared, as underlying neutral line rearranged to connect with large-scale neutral line southeast of this position.
333	N12	8/9	Birth of small active region.	134	S28	8/26	Partial disappearance of filament near west limb.
332	N23	8/10	Birth of active region that became a large class D spot group by 12 August, just before west limb passage.	131	N31	8/26	Small filament disappeared.
330	N36	8/5	Large, curved filament partially disappeared.	125	N12	8/17	Great filament disappeared at east limb--an apparent precursor to rearrangement of underlying neutral line and to its incorporation of large-scale cell north of this position.
327	S20	8/7	Remainder of filament enlarged and then disappeared.	120	S15	8/20-21	Filament disappeared.
313	N19	8/6	Filament disappeared; small region formed here next day.	100	N50	8/21	Birth of small active region near west limb; slow growth continued at west limb passage on 29 August.
310	S58	8/9	Birth of small active region.	85	N22	8/23	Large filament partially disappeared at east limb.
300	N19	8/8	Filament disappeared.				Maximum development of an outstanding class E spot group with "delta" magnetic configuration, high spot count and its largest and most numerous spots of follower polarity. Great flares occurred over a small isolated area of leader polarity in the center of the spot group. This group formed at trailing border of an equally large spot group of the previous rotation, which had in turn formed at the trailing edge of a large group during rotation 1521.
296	N19	8/8	Large leader spot divided, and the components diverged after this date.	84	S22	8/23	Birth of active region that grew to maximum 28 August as follower-dominant class D spot group.
294	N13	8/13	Maximum development of large, compact class D spot group.	75	N12	8/22	Small filament-like dark feature formed over the center of large, complicated, remnant plage that contained a small spot group.
266	N11	8/7	Birth of small active region on southern border of large region.			8/24	Filament enlarged and moved west at the apparent rate of 37/day (0.4 km/sec), passing over plage and neutral line structures west of this location.
250	N18	8/8	Birth of small active region.			8/30	Filament disappeared; last observed 20° west of its original location.
249	N33	8/17	Birth of active region that grew to maximum 17 August as bright, compact plage but with only a class B spot group. First of three strong regions that formed a day apart and sequentially eastward.	70	N08	8/22-23	Small filament disappeared south of great activity complex.
245	N24	8/13	Birth of small active region near west limb.	50	S29	8/27	Filament disappeared.
233	N12	8/19	Birth of second active region in sequence of three, with maximum 16 August as class C spot group.	48	S38	8/26	Filament disappeared.
221	N19	8/14	Birth of third region in sequence of three, with maximum 19 August as class E spot group. This series of three regions also formed a progression in size at maximum development.	35	S19	8/27	Birth of small active region.
207	N09	8/16	Large filament partially disappeared at east limb.			8/30	Second phase of growth began and continued slowly through west limb passage on 3-4 September.
200	S31	8/13	Filament disappeared a second time, having grown to very large size since previous disruption.	16	S21	8/28	Birth of small region in old, faint plage.
196	N33	8/17-18	Filament disappeared.	15	S14	9/5	Small region formed at west limb.
167	S31	8/19	OMP of large sunspot surrounded by active absorption features. Notable for rotation rate slower than normal for its latitude, as if its close association with a high-latitude neutral-line pattern affected its motion.			8/26	Birth of small active region near east limb.
150	N33	8/25	Western portion of filament disappeared.			9/4	Second region emerged near west limb.

Note: Days without H-alpha photographs were 11 and 31 August and 1 September 1967.

# H $\alpha$ SYNOPTIC CHART 1967 - ROTATION 1524

H $\alpha$  SYNOPSIS CHART  
1967 - Rotation 1525

*Long.	*Lat.	Date	Descriptive Notes	*Long.	*Lat.	Date	Descriptive Notes
331	S20	8/31	Birth of active region that maximized as small class D spot group by 2 September.			9/20	same neutral line southeast of the spot. Filaments disappeared together with the great, high-latitude filament on same neutral line.
312	N18	9/6	Birth of small active region.		N10	9/20	Birth of small active region.
300	N20	9/3	Birth of small active region.		S40	9/20	Great filament disappeared; associated with sunspot at S30 that showed an abnormally slow rotation rate, as if the high-latitude area bounded by the filament was coupled to the spot and slowed its motion.
297	N10	9/2	Maximum development of small class E spot group.				Filaments disappeared.
291	S21	9/1	Probable date of birth of small active region near east limb.	132			
				130	N35	9/16-18	
275	N17	9/11	Birth of small active region near west limb.				Birth of active region that grew to maximum by 18 September as class D spot group. Expansion of region appeared to cause numerous neutral-line re-arrangements nearby.
270	N22	9/3	Birth of small active region near east limb.	121	S25	9/16	
		9/8	Rapid growth began.				Filament material formed progressively from west to east along this curved neutral line.
		9/11	Maximum development as class E spot group.			9/25	All filament material disappeared.
268	S28	9/8	Partial disappearance of filament.	102	S15	9/21-23	
		9/10	Remaining portion disappeared.				
263	S29	9/11	Filament disappeared.	92	N42	9/23	Partial disappearance of large filament.
262	N12	9/11	Filament disappeared; small new plage formed in its position.	N15		9/23	Birth of active region within extensive remains of great activity complex of previous two rotations. This region continued growing to west limb passage, attaining a small class D spot group. Growth apparently led to disappearance of peculiar moving filament south of this location.
256	N25	9/7	Filament disappeared.				
251	S09	9/9-10	Filament disappeared.	90	N08	9/16-24	Peculiar filament moved progressively westward 15° during this period, passing over underlying plage and neutral-line structures. Filament very similar to the unusual absorption feature observed near these coordinates during the previous solar rotation. The filament disappeared the day a new region formed just west of this position.
220	N35	9/12	Filaments disappeared that formed eastern border of large-scale positive-polarity feature; re-formed next day.			9/21	Partial disappearance of filament.
188	S32	9/15	Great filament disappeared.		N63		
187	N09	9/14	CMP of active region notable for its counterclockwise vortical structure surrounding large leader spot and for its neutral line curving concentric to the spot; almost all of the plage lay on the following side of the neutral line. Produced major flare with proton emission.	82	N15	9/23	Birth of small active region.
				34	S30	9/29	Filament disappeared.
165	N50	9/12	Filament disappeared at east limb.	27	S22	9/30	Birth of small active region; slow growth continued to west limb passage 3 days later.
160	N30	9/14	Filament disappeared.	26	N08	9/27	Birth of small active region.
155	N10	9/19	Filament present 1 day only, just before region formed near this location.	20	S50	9/27	Filaments disappeared.
150	N18	9/21	Birth of small active region near west limb.				
149	S26	9/15	Filaments disappeared near and surrounding north side of large sunspot on second disk passage.				
		9/18-19	Filaments re-formed, as great filament developed along				

Note: Days without H-alpha photographs were 31 August and 1 September 1967.

# H $\alpha$ SYNOPTIC CHART 1967-ROTATION 1525

H $\alpha$  SYNOPTIC CHART  
1967 - Rotation 1526

*Long.	*Lat.	Date	Descriptive Notes	*Long.	*Lat.	Date	Descriptive Notes
345	N15	9/28	Birth of active region that grew to maximum 2 October as class D spot group.	210	N19	10/9	Birth of small active region.
343	N22	10/1	Small filament disappeared north of growing active region.	195	N15	10/8	Birth of active region that grew to maximum 12 October as class D spot group with large leader spot.
338	N25	10/3	Birth of small active region.			10/15	New phase of growth near west limb. Group axis had slightly negative inclination, i.e., leader spot at higher latitude than follower.
319	S39	10/1	Curved filament disappeared; completely re-formed by 5 October.	180	S35	10/11	Large filament disappeared.
312	N22	10/3	Birth of small active region within extensive remnant plage, and near location of small spot group present from east limb. Maximum development next day as class C group.	124	S26	10/16	Formation of plage and small spots near leader spot of small active region.
294	S17	10/1	Formation of plage and new, small spots near leader spot of small Class C spot group.	95	S22	10/14	Birth of small active region.
		10/4	Rapid growth began, reaching class D spot group with "delta" magnetic configuration by 6 October.	90	S30	10/16	Filament disappeared.
285	N15	10/1-2	Curved filament disappeared.	52	N18	10/18	Birth of active region that grew to maximum 20 October as class D spot group.
	S38	10/6	Large filament disappeared.	40	N38	10/23	Filament greatly enlarged from previous days.
275	S28	10/2	Filament disappeared.			10/24	Great filament disappeared.
270	S58	10/7	Filament disappeared.	35	N55	10/22	Filament disappeared.
263	N12	10/8	Birth of active region that reached maximum as class D spot group by 11 October at west limb.	30	N08	10/20	Formation of bright plage and beginning of new spot growth within moderately large old spot group. New growth quickly complicated the magnetic configuration.
260	N05	10/1	Large filament disappeared near east limb.			10/24	Second phase of even more rapid growth commenced.
		10/4	Filament re-formed and was very active for next 2 days.			10/27	Maximum development near west limb as class F spot group with strong "delta" configuration in the center of the region.
		10/7	Filament disappeared day before birth of strong active region near this location.	0	N30	10/27	Great filament disappeared.
	N23	10/10	Birth of small active region near west limb.				
250	N65	10/11	Filaments on both upper and lower borders of this slow-rotation polar pattern disappeared.				
235	S21	10/4	Filament disappeared.				
228	N12	10/3	Birth of active region with slow growth to maximum by 7 October as class C spot group.				
220	N18	10/1	Birth of active region on leading border of small region. Grew to small class D spot group on 13 October.				
214	S20	10/3	Birth of small active region.				

Note: Day without H-alpha photographs was 22 October 1967.

# H<sub>α</sub> SYNOPTIC CHART

1967 - ROTATION 1526

H $\alpha$  SYNOPTIC CHART  
1967 - Rotation 1527

Long.	Lat.	Date	Descriptive Notes	°Long.	°Lat.	Date	Descriptive Notes
353	N20	10/23	Birth of active region with spot group.	226	S26	11/9	Birth of active region with small spot group. Increase in activity of adjacent old region next day at west limb.
350	N35	10/27	Filament with 60-degree length disappeared.				
325	S16	11/2	Birth of active region with weak plage.	182	N27	11/13	Western half of curved filament disappeared.
320	N18	10/26	Birth of active center with follower-dominant spot group.	145	N10	11/10	Birth of active center that developed large type D spot group by 13 November.
	S12	10/27	Filament disappeared.	123	S14	11/12	Birth of active center with weak spot group.
315	N20	10/29	New plage with spots appeared at east end of group born on 26 October.	105	S19	11/18	Birth of small active center simultaneously with one at adjacent position (100, S22).
		11/2	Important spot growth north of old follower-dominant spot; continued into 3 November.	103	N17	11/15 11/19	Birth of active center with spots. Major spot growth.
305	N18	10/25	Birth of active center with small spot group.	100	S22	11/12	Birth of active center with small spot group.
304	S11	11/2	Birth of region with small spot group occurred simultaneously with birth of region at (325, S16).			11/18	New bipolar plage emerged through old plage simultaneously with new region adjacent at (105, S19).
295	S38	10/31- 11/02	Almost all of filament disappeared.	83	Equator	11/12	Equator-crossing filament disappeared.
282	S15	10/28	Semicircular filament disappeared with resultant large flare, in apparent response to new active center southeast of filament.	76	N08	11/16	Birth of active region that maximized by 20 November as class E spot group.
277	S30	10/27	Birth of active center with small spot group. Region later developed circular filament surrounding portion of follower polarity.	55	N02	11/15	Equatorial filament began slow disappearance; gone by 17 November.
268	S20	10/29	Birth of region with follower-dominant spot group 5° west of large symmetric spot. New group developed follower spots directly north of old spot.	39	S16	11/20	Birth of active center with weak spot group.
	S20	11/4	Additional spot growth.	35	N39	11/24	Large filament disappeared.
263	S27	11/2	Birth of small active center with short-lived spot group.	12	N15	11/17	Filament disappeared with resultant flare, apparently as response to small new region immediately east of filament.
255	N23	11/7	Filament disappeared with resultant flare.	4	N18	11/17	Birth of small new region.
240	S40	11/5	Filament disappeared.				
234	S22	11/2	Large symmetric sunspot divided into two parts that drifted apart 2° in latitude by west limb passage.				
		11/10	Large flare and/or major growth at west limb, preceded by emergence of new spot group SE of this position.				

Note: Day without H-alpha photographs was 21 November 1967.

# H<sub>α</sub> SYNOPTIC CHART

1967 - ROTATION 1527

H $\alpha$  SYNOPTIC CHART  
1967 - Rotation 1528

*Long.	*Lat.	Date	Descriptive Notes	*Long.	*Lat.	Date	Descriptive Notes
334	N25	11/25	Birth of active region with rapid growth to maximum 27 November as class E spot group near west limb. Leader and follower spots had high rate of divergence from one another.	142	N54	12/6	Filament disappeared.
320	N20	11/20	Probable date of maximum development of large class E spot group with open structure. Leader spot divided and components diverged after this date.	130	N23	12/4	Birth of active region near east limb that grew to maximum 8 December as class D spot group.
316	S28	11/26	Birth of small active region that merged with region to its east to form complex active area. Maximum development 29-30 November near west limb as class E group; contained "delta" magnetic configuration where leader of first group merged with follower of this group.	119	S18	12/8	Peak development of class D spot group.
315	N09	11/23	Birth of small active region.	116	N20	12/7	Birth of small active region.
310	S29	11/24	Birth of small active region.	110	S25	12/10	Birth of active region that grew to maximum 14 December as class E spot group. Merged with following portions of region to northwest.
300	S53	11/30	Filament disappeared at west limb.	97	S14	12/11	Birth of small active region that merged with older plage southeast of this location.
299	S15	11/29	Filament disappeared.	93	S20	12/7	Birth of small active region at east limb.
295	N40	11/26	Filament disappeared.		S33	12/14	Probable date of birth of active region containing class C spot group with large leader spot.
291	S27	11/24	Filament disappeared in apparent response to birth of nearby active region.	85	N35	12/8	Filament disappeared at east limb.
285	N20	11/28	Filament disappeared.	80	S02	12/11	Birth of tiny active region.
280	S19	11/25	Maximum development of small class D spot group.	66	N26	12/14	Birth of active region in which spot group grew to class D by 17 December; had diminished little by west limb passage on 20 December.
276	N12	11/25	New plage and small spots developed near leader spot.	65	N40	12/11	Large filament disappeared near east limb.
270	N20	11/29	Birth of small active region.	60	N20	12/17-18	Filament disappeared.
258	N35	11/26	Filament disappeared.	N13		12/20-21	Birth of small active region at west limb.
237	N25	12/2	Birth of small active region.	57	S32	12/11	Filament disappeared near east limb.
235	N20	12/4	Filament disappeared.	42	S22	12/14	Birth of small active region.
219	S37	12/6	Birth of small active region near west limb.	39	N21	12/11	Probable date of birth near east limb of active region that grew to maximum on approximately 16 December as class D spot group.
206	N08	11/28	Birth of small active region near east limb.	30	N15	12/13-14	Filament disappeared within extensive faint plage, in apparent response to rapid growth of region at the northern end of the filament.
202	S18	12/2	Birth of tiny active region.	28	N19	12/12	Birth of great active region that grew to maximum by 19 December as class F spot group. Formed in trailing portion of plage remaining from large, active region of previous rotation.
195	S14	11/29	Birth of small active region near east limb.	0	N39	12/20-21	Partial filament disappearance.
193	N27	12/1	Birth of small active region.				
177	N15	12/11	New plage growth at west limb.				
175	N11	12/7	Large filament disappeared in apparent response to growth of new active region nearby.				
160	N13	12/1	Birth of small active region near northern edge of large single sunspot.				
145	N12	12/11	Birth of small active region within extensive faint plage.				

Note: Days without H-alpha photographs were 9, 13-14, 17 and 20 December 1967.

# H<sub>α</sub> SYNOPTIC CHART

1967 - ROTATION 1528

H $\alpha$  SYNOPTIC CHART  
1967-1968 - Rotation 1529

$^{\circ}$ Long.	$^{\circ}$ Lat.	Date	Descriptive Notes	$^{\circ}$ Long.	$^{\circ}$ Lat.	Date	Descriptive Notes
344	N15	12/23	Birth of small active region.	90	S20	CMP 1/8-9	Complex of two active regions. Large spot on southern border of complex moved east relative to spots and plage to north, indicating a conspicuous amount of shear between the spot groups. The northern spots appeared to have formed just before their appearance at east limb, and had disappeared by west limb. The larger spot had returned from the previous rotation and endured for the next. Its position was significantly shifted eastward on each succeeding disk passage, even though at this latitude spots should be stationary in Carrington longitude.
340	N28	12/24-25	Disappearance of large, complex filament that had been enlarging and becoming more active for previous 3 days.				
339	S11	12/24	Birth of active region that had grown to small class D spot group by west limb passage on 26 December.	76	N09	1/6	Birth of small active region.
325	S16	12/20	Birth of active region that grew to maximum next day as class D spot group.	70	N10	1/11	Important spot and plage growth near leading edge of complex region. Maximum size of new spots occurred on 13 January.
302	S14	12/28	Birth of active region that grew to small class D spot group before west limb passage on 30 December.	63	N20	1/11	Formation of active filament.
300	S10	12/22	Filament disappeared.	62	N12	1/5	Significant new growth of plage and sunspots within large spotted region at east limb.
275	N43	12/23	Large filament disappeared near east limb.				
265	S55	12/27	Filament disappeared.				
255	S15	12/24	Birth of active region on northwest border of large returning active region. New region grew rapidly to class E spot group with maximum on 28 December. Both leader and follower spots became large and very dark before west limb passage on 2 January.	59	N15	1/9	Birth of small active region on southern border of large returning region. Became small class D spot group by 12 January.
249	S30	12/27	Filament disappeared.	53	S10	1/8	Birth of tiny active region.
210	S22	1/2	Filament disappeared on western boundary of activity complex.	42	N25	1/7	Birth of small active region on northern edge of large returning active region.
202	S19	12/26	Birth of small active region on western border of large, growing active region near east limb.	36	N08	1/13	Birth of moderate active region that attained maximum 15 January as class D spot group.
200	N35	12/29-30	Large filament disappeared.	25	N38	1/18	Filament disappeared.
197	S26	12/26	Probable date of birth at east limb of active region that grew to class D by 29 December. Leader and follower spots had rapid rate of divergence from one another.				
190	N19	1/4	Filament disappeared.				
170	N28	1/5	Filament disappeared.				
110	S18	1/1	Probable date of formation of moderate active region that grew to maximum as class D spot group by 5 January.				
96	N20	1/2	Probable date of formation of active region at east limb.				
		1/7	Maximum development as class E spot group.				

Note: Days without H-alpha photographs were 20, 24 and 29-30 December 1967.

# H<sub>α</sub> SYNOPTIC CHART 1967 - 1968 - ROTATION 1529

Last Revision 9 27 76 PSM

H $\alpha$  SYNOPTIC CHART  
1968 - Rotation 1530

*Long.	*Lat.	Date	Descriptive Notes
294	N28	1/23 1/25	Birth of small active region. Significant additional growth just before west limb passage.
288	N20	1/23	Large filament disappeared.
241	N01	1/25	Birth of small active region.
175	N38	1/26	Large filament disappeared.
171	S13	2/2	Birth of moderate active region near old leader spot of large decaying region.
167	S24	2/2 2/5	Birth of small active region omitted from this chart. Significant brightening just before west limb passage.
165	N13	1/30-31	Central meridian passage of largest sunspot group of Solar Cycle 20. Activity within this region was less than its size would have indicated, probably because its magnetic configuration was a simple bipole. Some complication of the configuration occurred after 29 January, as a new region formed near the trailing end of this group.
152	N15	1/29	Birth of moderate active region that merged with great region to its west by 31 January. Peak area was reached by 1 February.
127	N23	1/26	Region at east limb may have just formed. Reached maximum growth as small class D spot group by 30 January.
121	S11	1/29	Birth of moderate active region that slowly developed to maximum by 2 February.
107	S18	2/1	Birth of moderate active region at western end of east-west filament. Reached maximum 3 February as class D spot group.
105	S04	1/30-2/8 2/8	Filament extremely active throughout disk passage. Filament became especially large.
90	S14	1/30	Birth of moderate active region that reached maximum 3 February as class D spot group.
70	N12	2/9	New spots and plage formed within old extensive plage and near small old leader spot.
38	S28	2/11	Birth of small active region
17	S40	2/8 2/11	Large curved filament disappeared. Filament re-formed.

Note: Days without H-alpha photographs were 20 and 27-28 January 1968.

# H<sub>α</sub> SYNOPTIC CHART

1968 - ROTATION 1530

# H $\alpha$ SYNOPTIC CHART 1968 - Rotation 1531

*Long.	*Lat.	Date	Descriptive Notes	*Long.	*Lat.	Date	Descriptive Notes
335	N19	2/7	Small bright plage at east limb suggested this was date of birth of region that grew rapidly to become a complex class E spot group with "delta" configuration by 11 February. Source of proton event. Possible source of new interplanetary sector of negative polarity, which enlarged from this date through the remainder of 1968. Region was located on a major neutral line connecting to polar crowns in both hemispheres.	122	S10	3/2	Birth of tiny active region.
298	M45	2/19	Remainder of large filament disappeared.	117	N22	3/5	Brightening of plage on north side of filament associated with moderate decaying active region.
296	S25 S17	2/14 2/19	Birth of small active region.	100	S32	2/29	Filament disappeared.
290	N31	2/16	Filament on northern border of small negative-polarity cell disappeared.	66	S22	3/6	Birth of small active region within remnant plage of region that had lost its sunspots just hours earlier.
280	M48	2/17	Partial disappearance of large filament simultaneous with disappearance of filament at longitude 240, M46.	52	N21 N10	3/2 3/6	Birth of tiny active region. Partial disappearance of large S-shaped filament in apparent response to nearby developing active region.
258	N25	2/24	Birth of small active region near west limb.	42	S10	3/7	Birth of small active region.
240	M46	2/17	Filament disappeared near east limb.	35	N25	3/5	Birth of active region that was apparently associated with nearby disappearing filaments.
220	N10	2/23	Birth of active region, which grew to maximum 25 February as class D spot group.	30	N34 N09	3/6 3/11	Filament disappeared north of developing active region. Birth of small active region.
217	S27	2/24	Filament disappeared in apparent response to growth of small region east of this location.	2	S10	3/9	Birth of small active region.
212	S27	2/23	Birth of small active region near leading edge of small plage.				
201	N21	2/26	Birth of small active region.				
200	S15	2/21	Filament disappeared.				
190	N27	2/23	Filament disappeared.				
181	S32	2/26	Birth of small active region.				
158	S20	3/2	Filament disappeared within scattered faint plage north of significant region.				
150	S25	2/25	Peculiar plage developed to maximum and contained a peculiar class E spot group with a high spot count.				
149	S10	3/2	Birth of small active region.				
140	S55	2/25	Partial disappearance of large filament.				
123	N14	2/27	Maximum area of peculiar, compact class D spot group.				

Note: Days without H-alpha photographs were 12-13 February and 9-10 March 1968.

# H<sub>α</sub> SYNOPTIC CHART

1968 - ROTATION 1531

# H $\alpha$ SYNOPTIC CHART 1968 - Rotation 1532

*Long.	*Lat.	Date	Descriptive Notes	*Long.	*Lat.	Date	Descriptive Notes
355	N19	3/8	Birth of moderate active region that caused rearrangement of old neutral line to north.	116	S15	3/26	Birth of active region, which developed slowly throughout the disk passage, but never exceeded the size and complexity of class C spot group.
350	N18 S56	3/6 3/8	Large dark filament at east limb disappeared. Filament disappeared.	N11		3/29	Faint scattered plage began to appear near isolated leader sunspot that had been without attendant plage since east limb passage on 22 March. This marked the apparent return of a significant region 15° farther west than during the previous solar rotation -- a degree of eastward motion representing an exceptionally slow rotation rate for this latitude.
345	S20	3/14	Birth of active region at location of large S-shaped filament, which disappeared.				
275	N13	3/16-18	Unusually rapid disappearance of plage near small leader sunspot.	100	S25	3/26	Filament disappeared in apparent response to birth of active region just west of this location.
265	N17	3/16	Birth of small active region between two rapidly decaying regions.	93	N15	4/2	Birth of small active region near large double region. Old decaying leader spot to north exhibited counterclockwise rotation during disk passage.
252	N30	3/22	Neutral lines as marked by filaments rearranged to create small isolated negative-polarity cell centered on large leader sunspot. This spot had an abnormally slow rate of rotation, returning on the next solar rotation more than 20° of longitude to the east. This motion may have led to divergence from magnetic features to the west and, therefore, to this rearrangement of neutral lines.	86	S27	3/27	Filament disappeared in apparent response to birth of significant active region east of this location. Gradually reformed after 29 March.
245	N30	3/19	Central meridian passage of large sunspot with plage only in follower polarity fields until 19 March. Plage formed surrounding the spot as the neutral lines to the west underwent a rearrangement. Filament disappeared.	75	S21	3/25	Probable date of birth of significant region at east limb. Reached maximum 30 March as large class D spot group.
217	N18 N20	3/20-21 3/21	Filament disappeared in apparent response to rapid formation of active region to south.	63	S12	4/5	Partial disappearance of filament.
212	N11	3/21	Birth of moderate active region.	60	S28	3/31	Partial disappearance of filament.
208	S15	3/24	Filament disappeared.	42	N10	4/3	Birth of small active region, which developed into peculiar follower-dominant group by 5 April. No plage near follower spot.
203	S25	3/24 3/27	Birth of small active region. Important additional growth at west limb.	40-70	N20-40	3/30	Large S-shaped filament disappeared near east limb.
175	S12	3/20 3/23	Birth of small active region in trailing portion of older small plage. Rapid new growth created class C group with large leader spot.	30	S13	4/7	Birth of small active region within follower plage of large old region.
170	N18	3/26	Filament became double this day only, suggesting a temporary condensation above the original filament.	20	S15	4/8 4/9	Birth of small active region. More rapid growth that continued to west limb next day. Spots did not exceed small class C group.
160	N33	3/31	Birth of small bright plage at west limb.	5	N21	4/12	Significant bright region born at west limb.
128	N13	3/25	Spot group that formed before east limb passage reached maximum as a follower-dominant class D group. Leader spot became dominant after 26 March.	0-10	N25-50	4/4	Filaments disappeared.

Note: Days without H-alpha photographs were 9-10 and 20 March 1968.

# H<sub>α</sub> SYNOPTIC CHART

1968 - ROTATION 1532

# H $\alpha$ SYNOPTIC CHART 1968 - Rotation 1533

*Long.	*Lat.	Date	Descriptive Notes	*Long.	*Lat.	Date	Descriptive Notes
350	Equator -S25	4/7	Central meridian passage of north-south neutral line along which filaments formed and disappeared daily. Filaments were almost entirely gone on 10 April.	196	N20	4/19	Birth of small active region.
315	S42	4/6	Filament disappeared.	173	S25	4/24	Exceptionally large, dark filament disappeared.
300	S58	4/7	Partial disappearance of filament.	155	N12	4/26	Filament disappeared in apparent response to two near-by developing regions.
296	N25	4/12	Filament disappeared.	151	S35 N10	4/25 4/26	Birth of small active region.
290	N42	4/11	Large filament disappeared.	150	N30	4/27	Filament disappeared at west limb; became exceptionally large and dark during previous 4 days.
283	N23	4/6	Compact plage at east limb may have formed on previous day. Reached maximum about 10 April as class D spot group.	147	N17	4/23	Birth of small active region near large, dark filament. Division of filament occurred on 25 April.
282	S13	4/12	Birth of small active region.	134	N17	4/24	Birth of small active region at eastern end of filament.
252	S14	4/14	Birth of small active region.	115	N27	4/23	Filament disappeared.
248	N24	4/11	Peculiar large region. Near peak development it became a compact class D spot group with a very large leader spot. Region possessed almost no leader plage. Neutral line nearly encircled the leader spot, suggesting strong vortical development in the region.	105	N10	4/23	Birth of minor plage.
246	S26	4/15	Central meridian passage of region with small decaying sunspots; associated with filaments, which were active during most of the disk passage, to the north and south of this location.	55	N10	4/29	Filaments disappeared bordering conspicuous peninsula of negative polarity.
230	N30	4/11	Filament disappeared near east limb; located near isolated old leader spot with exceptionally strong vortical structure surrounding it.	40	N30	5/4	Filament disappeared, which had become very large and dark during previous 2 days. Activity may be related to growth of large region to east.
222	N32	4/17	Central meridian passage of remarkable sunspot. One of strongest cases of vortical fine structure in H-alpha. Virtually no plage near the spot. Exceptionally slow rate of rotation moved the spot 22° east of its longitude during previous solar rotation. Filaments to south and east of the spot active throughout disk passage.	31	N16	4/28 5/1 5/3	Birth of significant active region near east-west filament. Filament disappeared as region emerged. Rapid region growth. Peak development as large class D spot group.
218	S22	4/21	Filament, exceptionally active throughout its disk passage, became especially large just before west limb passage.	28	S18	4/27	Birth of small active region in follower plage of old region.
209	N10	4/16	Birth of tiny plage.	20	N10	4/29	Filament disappeared in apparent response to region developing to west.
206	S23	4/15	Minor plage growth near exceptionally active filaments.	1	N09	4/29	Birth of small active region.

Note: Day without H-alpha photographs was 30 April 1968.

# H<sub>α</sub> SYNOPTIC CHART 1968 -- ROTATION 1533

# H $\alpha$ SYNOPTIC CHART 1968 - Rotation 1534

*Long.	*Lat.	Date	Descriptive Notes	*Long.	*Lat.	Date	Descriptive Notes
357	S13	5/6	Birth of small region very near north-south filament; filament disappeared next day.	140	N22	5/19	Curved filament disappeared.
354	S15	5/7	Filament disappeared.	112	N24	5/24	Significant growth of isolated positive-polarity pole bordering northwest corner of great leader spot of major active region. Small spots and bright plage with very active filament structures remained visible until 28 May, just before west limb passage.
335	N19	5/2	Maximum development of class F spot group with few spots in the interior of the region. By 4 May, plage corridor became exceptionally wide, implying a low magnetic field gradient.	98	N02	5/22	Equatorial filament enlarged and became very active from this date until west limb passage 29 May.
324	S40	5/3	Small plage visible this day only.	77	S33	5/21	Birth of small active region.
306	N20	5/4	Maximum development of class E spot group with weak "delta" configuration in the leading cluster of spots.	76	N31	5/22	Filament near east limb disappeared.
305	S40	5/7-3	Large filament disappeared.	55	S20	5/20 5/30	Birth of moderate active region. Maximum development as bright plage with numerous small spots.
294	N16	5/4	Birth of moderate active region, which reached maximum 6-7 May as a class D spot group with a high spot count.	50	N36	5/31	Filament near west limb disappeared.
285	N14	5/9	"Collision" with new region to east.	40	N26	5/27	Birth of tiny plage that resulted in rearrangement of neutral line to west.
282	S15	5/5 5/11-12	Birth of moderate active region, which collided with older region to west next day. Reached maximum 10 May as simple class D spot group.	35	S40	5/31-6/1	Filament gradually disappeared.
278	N38	5/11	Filament near east limb disappeared. Filament re-formed weakly.				
233	S11	5/8	Filament disappeared.				
228	N10	5/8 5/13	Birth of small active region. Maximum development as class D spot group.				
216	N10	5/16	Birth of moderate active region that caused rapid rearrangement of magnetic patterns in its vicinity. Reached maximum 18 May as class D spot group.				
204	N11	5/16	Birth of small plage and tiny spots.				
180	S12	5/14	Large f-shaped filament disappeared.				
169	S28	5/12 5/16	Small, compact plage at east limb may have formed on previous day. Maximum development as class D spot group.				
160	N16	5/15	Filament disappeared.				
148	N10 S10	5/18 5/20	Birth of small active region. Filament disappeared after being very active during previous 5 days.				

Note: There were no days without H-alpha photographs.

H $\alpha$  SYNOPTIC CHART  
1968 - Rotation 1535

°Long.	°Lat.	Date	Descriptive Notes	°Long.	°Lat.	Date	Descriptive Notes
358	N11	5/28	Birth of small active region.	193	S38	6/12	Filament disappeared.
350	N40	6/2	Filament disappeared.	190	N40	6/16	Filament disappeared.
336	N11	5/28	Birth of active region.	182	S12	6/9	Birth of moderate active region that apparently caused filament disappearance 11 June at longitude 205, S12. Reached maximum 12 June as class D spot group with large penumbra area.
329	S30	5/30	Maximum development as class D spot group. Filament formed on west side of isolated large sunspot.	179	N13	6/12	Filament disappeared.
		5/29	Filament north of large leader sunspot disappeared and began to form in its place. This growth continued through much of the disk passage, accompanied by a simultaneous dissolution of the leader sunspot.	148	N30	6/12	Large filament near east limb disappeared.
	S32	6/5	Leader sunspot became a small spot without penumbra.	145	N40	6/13	Filaments disappeared.
328	N58	6/2	Filament disappeared, possibly simultaneous with and for same reasons as filament disappearance at longitude 350, N40.	144	S20	6/16	Birth of small active region
				114	S17	6/20	Plage and small spots formed near large isolated spot with strong vortical pattern to surrounding fibrils. Plage in this old region had been confined mostly to an area of follower polarity south of the east-west filament that lay south of the spot.
325	S34	6/5	New growth began in interior of large active region.	93	N26	6/17	Filament within scattered plage disappeared; it had been associated with large symmetric sunspot with strong vortical pattern to surrounding fibrils. Filament disappearance may have been consequence of rapid growth of strong active region to southeast.
318	S17	6/6	Birth of small active region.		S06	6/16	Birth of very small active region.
312	S26	6/5	Birth of small active region. Growth was continuing at west limb 9-10 June.	92	N13	6/16	Birth of major active region very near old leader sunspot that had returned from previous rotation. Rapid growth to compact class E group. Relative motion between old spot and leader of new group.
298	N21	6/7	Filament within plage disappeared with resultant two-ribbon flare.			6/24	Maximum sunspot area approximately 1500 millionths of the solar hemisphere.
290	S35	6/8	Filament disappeared.		N02	6/23	Birth of small active region.
248	S12	6/8	Peculiar sunspot group appeared at east limb 2 June as irregular class D group, rapidly lost penumbra, and exhibited large relative motions among its spots. By this date a small delta configuration was present with an active dark filament passing between the opposite polarity spots. The filament disappeared followed by a 1b flare that was the first to be photographed with a rocket borne imaging X-ray telescope flown by American Science and Engineering, Inc.	71	S12	6/18	Curved filament disappeared between 1400 and 1900 UT.
				65	N33	6/21	Large filament disappeared.
245	N43	6/9	Class 2b proton flare occurred.	40	S17	6/24	Filament disappeared in apparent response to slowly developing region to the east.
238	N10	6/6	Large filament disappeared.	28	S25	6/26	Filament disappeared.
				25	S15	6/21	Birth of moderate active region, which slowly developed to maximum by 27 June as a very extended class C group with numerous spots.
232	N22	6/11	Birth of small active region.	8	S17	6/25	Birth of small active region. Maximum 28 June as rudimentary class D spot group.
216	N11	6/15	Birth of small active region near west limb.		N11	6/26-27	Central meridian passage of large, complex class C spot group with counterclockwise rotation of spots in leading cluster.
215	N35	6/12-13	Filament disappeared.				
	S16	6/12	Birth of very small active region.				
206	N26	6/12	Filament formed.				
		6/15	Filament disappeared.				
205	S12	6/11	Filament disappeared that had been exceptionally large and dark since east limb passage 6 June.				
		6/12	Filament reformed.				

Note: There were no days without H-alpha photographs.

# H<sub>α</sub> SYNOPTIC CHART 1968 — ROTATION 1535

# H $\alpha$ SYNOPSIS CHART 1968 - Rotation 1536

*Long.	*Lat.	Date	Descriptive Notes	*Long.	*Lat.	Date	Descriptive Notes
354	N29	6/26	Birth of moderate active region that reached maximum 28 June as class D spot group.	152	N28	7/12	Birth of small active region accompanied by formation of dark filament southeast of this location. Region maximized next day and filament continued large and active for remainder of disk passage.
328	N11	6/25	Birth of small active region.	140	S15	7/12	Filament material north and south of this location disappeared, leaving the central portion large and active. This section slowly enlarged throughout remainder of disk passage.
326	N19	7/3	Birth of small active region.	124	N45	7/16	Filament disappeared.
313	S05	6/25	Small compact plage at east limb suggested this date as birth of small active region.	122	S23	7/12 7/19	Filament within faint plage disappeared. Second disappearance of filament after gradually re-forming.
312	N09	6/27	Birth of small active region.	120	S30	7/15	Birth of small active region within filament channel.
308	N18	6/29	Curved filament disappeared.	118	S08	7/16	Nearby filament section became very active for remainder of disk passage.
307	N17	7/5	Birth of small active region at former position of curved filament.	116	N17	7/12 7/17	Birth of small active region. Filament disappeared; re-formed next day. Filament disappeared again.
300	S35	7/2	Central meridian passage of large remnant plage whose neutral line evolved conspicuously from an S-shape to a straight line through the plage.	116	N16	7/19	Birth of small active region that was still growing slowly at west limb on 21 July.
272	N07	7/4	Birth of small active region.	109	N31	7/16	Birth of tiny plage and spot.
265	N48	7/1	Filament disappeared.	100	N45	7/16-18	Filaments on western boundary of this cell slowly disappeared.
250	S43	7/7	Filament disappeared.	97	S05	7/19	Birth of small active region.
248	S21	7/8	Filament bordering remnant plage disappeared.	66	S10	7/18	Birth of small active region.
235	S07	7/3	Filament disappeared.	58	N05	7/23	Equator-crossing filament nearly disappeared after being very active for previous 9 days.
225	N27	7/2 7/7	Filament partly disappeared. Filament disappeared; gradually re-formed during remainder of disk passage.	51	S18	7/22	Rapid growth within plage that had been slowly evolving with small spots for previous week. Maximum development as class E spot group with group axis steeply inclined from normal east-west orientation.
224	N14	7/8	Formation of filament.	11	N11	7/25	Birth of moderate active region within remnant plage. Growth to class D spot group by 27 July and possibly some growth continued through west limb passage on 29 July.
209	S10	7/8	Birth of small active region.	10	S18	7/19	Birth of large active region, which developed to maximum by 24 July as class E spot group.
206	N26	7/11	Formation of filament.				
205	S13	7/8	Filament disappeared in apparent response to birth of active region west of this location.				
181	S14	7/9	Isolated leader sunspot rapidly diminished after this date. Associated filament to the southeast also disappeared on this date.				
170	S26	7/9 7/10 7/14	Filament disappeared. Filament slowly re-formed during this and next 2 days. Filament disappeared.				
156	N14	7/12-13	Central meridian passage of leader sunspot of region that had emerged and blended with larger region to the west to create a large and very active complex. This spot had merged with follower spots of western region to form a "delta" magnetic configuration over which several strong flares occurred early in the disk passage, followed by a proton event. This area redeveloped on the next solar rotation to produce additional large solar flares.				
154	S17	7/12 7/16	Birth of small active region. Additional growth in region; original spots had disappeared before this date.				

Note: Day without H-alpha photographs was 24 July 1968.

# H<sub>α</sub> SYNOPTIC CHART

1968 - ROTATION 1536

H $\alpha$  SYNOPTIC CHART  
1968 - Rotation 1537

*Long.	*Lat.	Date	Descriptive Notes	*Long.	*Lat.	Date	Descriptive Notes
358	S23	7/25	Birth of small active region.	137	S02	8/8-11	developments at this longitude--developments associated with major restructuring of the magnetic patterns near the solar equator.
348	N34	7/23	Filament within faint plage disappeared.			8/12	Rapid variations in faint plage before emergence of major region at this location.
		7/27	Filament reformed.				Birth of important active region, which reached maximum 14 August as class E spot group.
		7/28	Filament disappeared.	136	N09	8/8-11	Rapid variations in plage without sunspots occurring during interval of neutral line rearrangements west of this location.
342	N11	7/26	Birth of moderate active region, which attained maximum 29 July as a small, simple class D spot group.				
323	N27	7/25	Birth of small active region, which reached maximum 28 July as class B spot group.				
314	N20	7/30	Filament disappeared in apparent response to active regions developing nearby.				
308	S07	7/29	Birth of small active region.	116	S07	8/14	Birth of small active region.
286	S22	7/29	Filament disappeared.	102	S13	8/15	Birth of small active region.
	S47	7/28	Filament disappeared, possibly associated with filament disappearance next day at lower latitude along same neutral line.	100	N17	8/11	Birth of moderate active region, which reached maximum by 14 August as extended class C spot group.
						8/17-19	New plage growth before west limb passage.
282	S12	7/26	Birth of small active region, which remained faint and spotless.	95-120	N05	8/11	Filaments along this neutral line disappeared, as new active region emerged at northern end of filament chain.
280	N08	7/27	Birth of important active region on southern boundary of large returning active region.	89	S04	8/15	Birth of small active region.
		7/31	Maximum development as class E spot group, while another region emerged between it and the older region to the north.	75	S45	8/15	Filament disappeared for 1 day only.
				66	N10	8/12	Filament disappeared; gradually reformed and stayed active throughout remainder of disk passage.
271	S21	8/2	Birth of small active region, which developed small class D spot group by next day.	62	N27	8/20	Filament disappeared near west limb.
260	N25	7/28	Filament disappeared.	52	N10-20	8/17-18	Filaments disappeared, as neutral lines rearranged.
		8/3	Filament reformed.	44	S14	8/18	Filament formed between active regions.
253	N18	8/2	Birth of tiny plage.	39	N02		Filament aligned along meridian disappeared.
226	S08	8/6	Birth of small active region.			8/14	Filament reformed.
209	S10	8/5	Birth of small active region.			8/16	Filament disappeared.
202	N13	8/7	Birth of small active region.			8/19	Filament reformed near west limb.
193	N02	8/4	Birth of small active region.			8/22	Central meridian passage of small spot south of very large leader spot of complex region. This small spot probably represented the region remnant from the previous disk passage.
190	S12	8/2	Filament disappeared.	517		8/18	
176	N15	8/7	Birth of tiny region between two remnant plages.				
164	N10	8/9	Filament disappeared.	30	S16	8/12	Birth at east limb of moderate active region, which grew rapidly and "collided" with trailing parts of large region to its west. The developing leader spot combined with the strong follower spot of the older region on 15 August to form a "delta" magnetic configuration. Combined regions had appearance of large class F spot group.
160	N12	8/8-9	Central meridian passage of large, round spot group with strong "delta" configuration that produced major flares.			8/19	Birth of small active region south of filament.
						8/21	Filament north of region disappeared.
152	S07	8/9	Filament formed as a continuous structure across the solar equator and into the large active region.	28	S05	8/15	Filament formed.
		8/10	Filament disappeared, probably as neutral lines rearranged.	12	S14	8/18	Peak development of class E spot group that was going when first observed at east limb on 14 August.
142	S15	8/7	Filaments disappeared.				
	S24	8/13	Just before west limb passage important active regions emerged simultaneously 5° east and west of this neutral line, completing a complicated chain of

*Long.	*Lat.	Date	Descriptive Notes	*Long.	*Lat.	Date	Descriptive Notes
342	N29	8/17 8/22	Birth of small active region. Additional rapid growth occurred to make this moderate size region.				enlarge for remainder of disk transit, returning for the next 3 solar rotations. Proton flares occurred during the next 2 solar rotations.
323	N09	8/24	Maximum development as class D spot group.	150	N08	9/8	Growth of bright plage and new spots north of leader spot just before west limb passage.
		8/22	Filament disappeared that had been very active during previous 3 days.				Filament in faint plage disappeared.
		8/24	Filament reappeared 1 day only.	145	N29	9/4	Large filament disappeared.
320	N23	8/25	Birth of small active region.			9/7	Filament partially re-formed.
316	N05	8/21	Birth of small active region near active filament.	138	S16	9/3	Birth of tiny active region that disappeared by 7 September.
313	S18	8/19	Birth of moderate active region that reached maximum 23-24 August as class D spot group.				Filament disappeared.
307	N20	8/26	Birth of small active region.	129	N19	9/6	Active equatorial filament disappeared.
305	S30	8/24-25	Filament disappeared in apparent response to birth of active region.	123	N05	9/9	Birth of small active region at leading border of faint plage.
		8/26	Filament re-formed.	116	N10	9/7	New bright plage formed after first plage had become very faint.
300	S30	8/22	Birth of small active region near filament.			9/12	Birth of small active region.
294	N18	8/31	Birth of active region near west limb that continued to grow 01 September. It returned 2 weeks later as a spotted region.	103	S15	9/12	Filament formed.
				100	N25	9/7	Filament became especially tall and dark.
280-310	M45	8/21	Filaments disappeared.	98	S16	9/6	Birth of small active region that had disappeared by 20 September.
265	S40	8/28	Filament disappeared.	95	N38	9/10	Faint filament disappeared; filament nearby at lower latitude then became especially large and dark.
260	N10	8/25 8/28 8/28 9/2	Filament disappeared. Filament re-formed. Filament disappeared at west limb.	93	N13	9/13	Birth of small active region.
256	S06	8/27-28	Birth of small active region.	91	S21	9/6	Birth of moderate active region that reached maximum development as class E spot group by 11 September.
255	S17	8/30	Birth of small active region.				Birth of small active region.
245	N17	9/3	Birth of active region near west limb.	89	N07	9/14	Birth of tiny plage that disappeared by 8 September.
237	S17	9/3	Birth of active region near west limb.	86	N22	9/5	Birth of small active region that merged with nearby region to the west.
235	S13	8/29	Formation of filament.	82	S21	9/9	Birth of moderate active region that developed slowly with only small spots until 12 September.
230	N20	9/3	Filament disappeared in apparent response to region developing west of this position.	74	S12	9/7	Rapid growth occurred that reached peak as class D spot group by next day.
220	N25	9/3	Birth of tiny region.			9/12	Filament disappeared.
210	N40	8/28 9/4	Filament disappeared near east limb. Filament re-formed.	55	N26	9/16	Filament re-formed.
203	N18	8/28	Filament within faint plage disappeared near east limb.	31	S21	9/17	Birth of small new region within remnants of old plage near west limb.
186	N12	8/28	Birth of moderate active region at east limb.	23	S27	9/14	Filament within faint plage disappeared.
		8/31	Maximum development as class D spot group.	22	N22	9/14	Filament north of faint plage disappeared.
182	N17	8/29	Filament embedded in plage disappeared.	0	N25	9/16-22	Filament enlarged and darkened throughout this period. It was exceptionally tall by the time it reached west limb.
		9/6	Filament near east limb disappeared in apparent response to developing active region.				
		9/2	Large filament disappeared in response to growth of major active region near its eastern end.				
173	S16	8/31	Birth of major active region that grew to class E spot group by 3 September. Leader spot continued to

# H $\alpha$ SYNOPTIC CHART 1968 - Rotation 1530

*Long.	*Lat.	Date	Descriptive Notes	*Long.	*Lat.	Date	Descriptive Notes
328	N28	9/22	Filament disappeared.	197	S25	9/30	Large filament disappeared.
313	N16	9/22	Filament disappeared.	196	N22	9/22	Probable date of birth of small active region at east limb.
310	S10	9/20	Birth of small active region.	173	S24	9/28	Filament in old plage near large single spot disappeared with resultant major flare.
		9/24	Second growth phase continued until west limb passage 26 September.			10/4	Filament again disappeared after gradually re-forming and again a flare of major proportions occurred. This spot represented the return of the leader of an important region--one that returned with major activity during rotation 1540.
298	N05	9/24	Filament enlarged.				Birth of small active region.
297	N23	9/19	Birth of small new region.	172	S08	9/28	Filament disappeared in apparent response to growth of active region near its northeastern end.
		9/24	Birth of small active region north of old leader sunspot.	162	N15	10/3	Birth of moderate active region that reached maximum 4 October as small class D spot group.
294	N16	9/22	Filament within faint plage near sunspot disappeared.	155	N27	10/2	Filament disappeared.
290	N16	9/21	Rearrangement of neutral lines isolated negative-polarity cell east of this location.	117	S32	10/6	Birth of small active region.
280	N17	9/18	Filament disappeared near east limb.	113	N16	10/3	Birth of major active region that grew to maximum by 6 October as class E spot group with a high spot count. Region was isolated from other strong regions and was relatively simple in structure.
		9/19	Filament re-formed.	106	N06	10/3	Birth of small active region near west limb.
		9/18-19	Birth of small active region.	103	S16	10/11	Curved filament in faint plage disappeared.
275	N29	9/24	Filament disappeared.	99	S22	10/3	Probable date of birth of small active region that reached maximum 3 October with peculiar class C spot group. Formed part of compact cluster of at least three active regions. Marked the third major activity complex to form from the merger of multiple regions during this solar rotation.
272	N02	9/19	Birth of small active region on western border of small plage.	96	N17	10/1	Birth of small active region.
255	S18	9/22	Birth of small active region.			10/5	Rapid region growth continued to west limb 13 October.
252	N18	9/22	Probable maximum of large class E spot group that had large, simple leader and follower spots early in disk passage.	87	N20	10/5	Bright plage contained conspicuous circular plage corridor.
		9/24	Numerous new spots and bright plage developed in following portion of region, simultaneous with growth of three new regions east of this region.			10/6	Large number of new small sunspots with little apparent organization.
240	N17	9/25	Birth of moderate active region, which contained numerous spots, within position of small old region. Reached maximum 27 September as small class D spot group, and its plage began to merge with large region to its west. This western region began a rapid decay after the merger.			10/9	Plage and spots rapidly disappeared after this date.
			Birth of small active region.	72	N10	10/5	Birth of small active region.
235	S18	9/28	Birth of small active region that formed part of large activity complex.	65	S27	10/11	Large filament disappeared.
228	N12	9/24	Birth of moderate active region that formed part of extensive activity complex.	29	N25	10/15	Filament disappeared.
224	N19	9/23	Filament began gradual disappearance over the next 4 days.	18	N18	10/11	Birth of small active region, which coincided with increased activity in nearby filament to the west.
215	N40	9/28	Birth of moderate active region near small sunspot. Reached maximum 27 September as class D spot group and merged with bright plage to the east to form part of a major activity complex.	11	S15	10/7-8	Large class D spot group, probably near maximum development, appeared at east limb.
213	N16	9/25	Birth of small active region.				
200	N23	9/30	Birth of small active region.				

Note: There were no days without H-alpha photographs.

# H $\alpha$ SYNOPTIC CHART 1968 - Rotation 1540

*Long	*Lat.	Date	Descriptive Notes	*Long.	*Lat.	Date	Descriptive Notes
353	S14	10/13	Birth of small active region at northern end of small filament.	173	S14	10/22	Loop prominences, coronal rain and yellow-line corona accompanied east limb passage of one of the greatest active regions of the solar cycle. Third disk passage for the large central sunspot. New spots formed surrounding old spot in a sequence of at least five additional bipolar sets.
350	N18	10/19	Birth of small active region 2 days before west limb passage.			10/25	Large filament disappeared within this large plage.
349	S22	10/13	Filament disappeared in apparent response to two developing active region nearby.			10/29-31	Important new spot growth occurred west and east of the very large and central sunspot. Major flares with proton emission occurred during this growth and during movement of the large spot toward the new spots in the region's western portion. (See "Data on Solar-Geophysical Activity October 24-November 6, 1968," Report 147-8, Parts 1 and 2, completed by J. Virginia Lincoln, World Data Center A, Upper Atmosphere Geophysics, ESSA, March 1970)
342	S19	10/12	Birth of small active region that reached maximum 16 October as class C spot group.				Filament disappeared near west limb.
325	S25	10/19	Large filament disappeared.	157	N07	11/3	Emergence of new spots within leading portion of old region. Growth continued only through next day and did not exceed a class B spot group.
315	N20	10/14-15	Large class E spot group reached maximum size.	152	N29	10/28	Filament disappeared at east limb. Gradually re-formed during disk passage and extended north through decaying active region.
447	N15	10/15	Large section of filament disappeared.				Filament disappeared again.
307	N30	10/14	Filament disappeared.	145	N19	10/24	Almost all of active, equatorial filament disappeared.
249	S12	10/15	Birth of small active region.			11/1	Birth of small active region.
298	N10	10/23	Additional growth just before west limb passage.	130	S03	11/3	Birth of small active region.
296	N05	10/13	Part of filament disappeared.	127	N16	11/5	Birth of small active region.
			Probable date of birth of small active region at east limb.	105	S30	11/5	Birth of small active region.
285	N04	10/18	Filament disappeared.	100	S17	11/1-3	Important growth of new spots within large old region. Additional spot growth at west limb.
282	S32	10/17	Filament disappeared near east limb.	98	S35	11/1	Filament disappeared.
269	S05	10/23	Birth of moderate active region that reached maximum as class D spot group late next day.	93	N29	10/30	Filament disappeared at east limb.
242	N16	10/20	Maximum development of complex and active class E spot group. Large relative proper motions of sunspots.	84	N15	10/31	Almost all of filament disappeared.
				82	N21	11/3	Filament within faint plage disappeared.
235	N03	10/18-23	Filament exceptionally active.	80	N14	11/9	Birth of small active region near west limb on lower border of negative-polarity cell.
			Western portion of filament disappeared.	78	S13	11/3	Birth of small active region.
230	S12	10/20	Filament partly disappeared.	75	N20	11/4	Remaining portion of filament disappeared.
		10/21	Filament re-formed.	52	N35	11/10	Birth of small active region.
		10/22	Filament completely disappeared.	45	S22	11/9	Birth of small active region.
227	N13	10/25	Birth of small active region within area of faint plage and near active filament.	40	S13	11/4	Birth of small active region.
212	S18	10/23	Maximum development of peculiar class C spot group with numerous small spots north of group's large symmetric leader spot. These smaller spots moved west relative to the large leader spot. The former might have been a separate bipolar group that emerged later than the large leader spot.	26	S24	11/7	Filament disappeared.
		10/27	Emergence of new bipolar plage and spots in trailing portion of this region.	6	N16	11/7	Filament disappeared.
206	N36	10/24	Filament disappeared.				
198	S-5	10/31	Partial disappearance of filament.				
188	S31	10/27	Southern portion of large filament system disappeared.				

Note: There were no days without H $\alpha$  photographs.

# H:α SYNOPTIC CHART

1968-ROTATION 1540

H $\alpha$  SYNOPSIS CHART  
1968 - Rotation 1541

°Long.	°Lat.	Date	Descriptive Notes	°Long.	°Lat.	Date	Descriptive Notes
348	N19	11/7	Simultaneous birth of two bipolar regions within an existing faint plage. The more northern of the two new regions grew rapidly to form a follower-dominant, compact class D spot group with strong "delta" configuration. Spots within the common penumbra exhibited conspicuous counterclockwise motion about a common center (See "Data on Cosmic Ray Event of November 18, 1968 and Associated Phenomena," Report UAG-3, compiled by J. Virginia Lincoln, World Data Center A, Upper Atmosphere Geophysics, ESSA, April, 1970.)	227	S22	11/25	Birth of small active region near west limb.
		11/18	Great limb flare produced one of the largest proton events of the solar cycle.	196	S18	11/20	Large curved filament disappeared. Similar filament on same neutral line made sudden disappearance on previous solar rotation.
347	N15	11/15-16	Complex absorption features on boundary of small negative-polarity cell were especially large and active.	178	S05	11/22	Filament disappeared; gradually re-formed during remainder of disk passage.
335	N25	11/10	Filament formed and remained active for remainder of disk passage.			11/27-29	Section of filament crossing equator became especially large. May have disappeared 29 November.
		11/17	Filament disappeared near west limb. This event appeared as part of major rearrangement of magnetic patterns north of the proton-flare region. The filament disappearance preceded by 1 day the great limb event of 18 November and may have been a precursor to that great flare.	175	S22	11/26	Birth of small active region within remnants of great active region and between two large active filaments.
310	S12	11/10	Maximum plage development of the blend of two bipolar regions.	169	S14	11/25	Central meridian passage of large sunspot on its fourth disk passage. Site of extreme activity during previous rotation. Irregular configuration of this class E spot group suggestive of at least two blended bipolar regions. Previous disk passage displayed blend of at least 6 bipolar units.
		11/15-16	Rapid dissipation of plage.	150	20	11/21	Birth of small active region that had nearly disappeared by 28 November.
		11/17	Active small filaments within remnants of these regions.			11/30	New region growth 2 days before west limb passage.
303	N21	11/15	Small active filament within extensive faint plage disappeared.	145	N25	11/25	Small filament disappeared.
296	N38 and N47	11/16	Filaments disappeared.	143	S07	11/22	Birth of moderate active region near east limb.
292	N17	11/16	Birth of small active region that reached maximum 19 November as small class D spot group.			11/26	Maximum region development as compact class D spot group.
285	S25	11/19	Birth of small active region.	135	S30	11/25-27	Sections of very large filament disappeared on each of these days.
269	N08	11/14-15	Birth of tiny active region that disappeared by 18 November.			11/30-12/3	Filament became exceptionally large again last 4 days of disk passage.
260	N09	11/14-15	Birth of small active region that disappeared by 19 November.	90	S12	11/27	Birth of small active region.
250	S24	11/19	Filament disappeared.	87	N06	12/4	Small filament within faint plage disappeared with resultant two-ribbon flare.
240	M11	11/18	Maximum development of peculiar class D spot group with large leader spot that later divided into several parts.	74	N12	12/4	Birth of tiny plage.
				57	S06	12/2	Birth of small active region.
				38	S13	11/30	Birth of moderate active region that reached maximum 2 December as class D spot group with large symmetric leader and follower spots.
				30	N12	12/2	Maximum development of major class E spot group, which formed near east limb ~ 28 November.
						12/7	Region greatly enlarged by formation of new region on northern border.
						12/5-9	Maximum development of complex of two class E spot groups near west limb.

Note: Days without H-alpha photographs were 14 and 29 November 1968.

Long		Lat	Date	Descriptive Notes	Lat	Date	Descriptive Notes
358	N18		12/11	Birth of small active region in leading portion of remnant proton-flare region.	176	12/23	Rapid formation of major active region that maximized 25 December as class D spot group.
354	N10		12/14	Large filament, associated with large remnant plage from proton-flare region of previous disk passage, disappeared.	170	12/24	Large filament disappeared in apparent response to rapid growth of nearby active region.
350	N19		12/12	Large limb event with protons occurring in returning region that produced proton flare 18 November.	12/25		Large filament re-formed.
320	S24		12/9 12/12	Large filament disappeared. Second disappearance of filament after gradual re-formation.	150	12/20	Formation of new plage and small spots near old leader sunspot. Plage especially bright 22 and 24 December.
297	N23		12/14	Birth of moderate active region that grew to class D spot group with brilliant plage by 17 December; it may have been still growing at west limb passage 18 December.	135	12/28-30	Filament formed and became very active last 3 days of disk passage.
290	N10		12/8	Birth of small active region.	134	12/19	Birth of small active region at east limb.
288	S31		12/12	Maximum development of class F spot group, which may have formed 6 December just before appearing at east limb.	125	12/22	Filament disappeared along same neutral line as filament that disappeared in southern hemisphere on same day.
281	N42		12/14	Disappearance of small filament.	120	12/22	Large filament disappeared near east limb.
277	N23		12/10	Birth of very small active region.	118	12/23	Birth of small active region.
264	S10		12/20	Birth of small active region at west limb.	105	12/27	Filament at central meridian was especially active throughout its disk passage.
252	S24		12/19	Portion of large S-shaped filament disappeared.	101	12/22	Probable maximum development of class F spot group near east limb.
232	N35		12/21	Filament disappeared near west limb.	70	12/29	Filament disappeared.
220	N30		12/17	Birth of small active region.	54	12/30	Filament disappeared.
210	N05 S18		12/14 12/17 12/18	Birth of small active region near east limb. Birth of moderate active region. Rapid region growth to class D spot group.	45	1/4	Filament disappeared.
195	S30		12/17	Long large filament disappeared near east limb in apparent response to developing region at S18 and just west of filament.	38	Equator 1/1	Central meridian passage of especially active filament. Most filaments paralleling the solar equator appeared more active than normal.
	S08		12/21	Filament disappeared on northern border of positive-polarity cell.			Filament partially disappeared.
192	S03		12/19	Birth of tiny plage.	28	S40 1/1	Central meridian passage of small, especially active filament.
191	N15		12/21	Small filament disappeared.	22	Equator 1/2	
185	S22		12/22	Birth of very small region that disappeared by 24 December.			

Note: Days without H-alpha photographs were 26-27 December 1968

Long.	Lat.	Date	Descriptive Notes	Long.	Lat.	Date	Descriptive Notes
322	N11	1/12	Birth of small active region at west limb.	145	N13	1/20	Formation of new spots and plage in center of large old region with open class F spot group.
310	N11	1/11	Birth of small active region, which was brightest 13 January just before west limb passage.	132	N15	1/23	Birth of small active region at trailing boundary of large active region.
304	N11	1/4	Filament disappeared near east limb in apparent response to developing region south of this location.	131	N34	1/15	Probable date of birth of moderate region at east limb. Grew to small class D spot group by 18 January.
297	N04	1/3	Birth at east limb of moderate active region that reached maximum 7 January as class E spot group.	122	S28	1/20 1/23 1/24	Filament partially disappeared. Complete disappearance of major section of filament. Filament re-formed and became especially large through west limb passage 28 January.
281	S09	1/11-12	New plage growth around leader sunspot.	96	N10	1/21	Birth of major active region that grew to class E by 27 January.
280	S14	1/12	Small pl. visible this day only.	95	N35	1/28	Filament disappeared.
272	S44	1/14	Filament disappeared.	68	N16	1/27-23	Large filament disappeared near east limb in apparent response to nearby developing active region. Gradually re-formed after central meridian passage.
258	N12	1/14	Birth of moderate active region that reached a small class C spot group before west limb passage 17-18 January.	66	S40	1/22-23	Large filament disappeared near east limb and south of faint plage.
255	S15	1/5 1/10	Probable date of birth of major active region just before it crossed east limb. Maximum area of compact class D spot group with exceptionally large leader penumbra.	62	N12	1/25 1/29	Birth of small active region. Rapid new growth produced small class D spot group by next day.
232	N10	1/14	Birth of small active region.	55	S22	1/28	Filament disappeared.
220	S38	1/12	Part of large filament disappeared as neutral lines underwent major rearrangement.	51	N20	1/31	Birth of small active region that attained class D spot group and may have continued to grow after west limb passage 2 February.
215	N36	1/18	Filament disappeared.	45	S30	1/28	Filament disappeared, simultaneous with, and on same neutral line as, filament disappearance at (55, S22).
198	N20	1/16	Filament disappeared.	43	N16	1/24	Birth of small active region.
192	N10	1/13	Birth of tiny active region that disappeared by 20 January.	40	N22	1/30	Filament disappeared.
170	S22	1/18	Birth of small active region that disappeared by 18 January.	38	S11	2/3	Small plage formed at west limb.
168	N24	1/20	Rearrangement of neutral lines isolated following polarity area of old active region and formed a large, continuous filament where formerly two separate filaments existed. Old leader sunspot north of the filament dissipated rapidly after this date.	11	N20	1/29	Filament disappeared; gradually re-formed during remainder of disk passage.
150	S15	1/21	Filament disappeared.	5	S13	1/29	Filament disappeared.
			Filaments east and west of this location disappeared together with simultaneous enlargement of filament at (125, S20) on same continuous neutral line.	0	S32	1/28	Filament disappeared near east limb.

Note: Days without H-alpha photographs were 10, 15 and 22 January 1969.

H $\alpha$  SYNOPTIC CHART  
1969 - Rotation 1544

*Long.	*Lat.	Date	Descriptive Notes	*Long.	*Lat.	Date	Descriptive Notes
347	S10	1/30	Small plage visible this day only.	120	S25	2/15	Filament disappeared; gradually re-formed during next 5 days.
345	S25	1/31	Filament disappeared.	111	S18	2/15	Birth of small active region.
325	N08	2/7	Small bright region formed near west limb.	107	N38	2/20-23	Filament especially large and active.
296	N01	1/31	Probable date of birth of active region that grew to maximum 6 February as large class D spot group.	98	S05	2/17	Equatorial filament disappeared.
295	S15	2/9	Birth of moderate active region that grew to class D spot group by 10 February and began to diminish by west limb on 11 February.	85	S29	2/19-20 2/24	Birth of small active region. Rapid growth to small class D spot group in compact and brilliant plage.
293	N27	2/8	Central meridian passage of leader sunspot that had returned for third disk passage.	75	N20	2/20	Birth of small active region on northwest boundary of great activity complex.
290	S29	2/8-9	Large filament disappeared in apparent response to rapid growth of nearby active region.	73	N11	2/21	Birth of major new area of spots and plage on southern border of old leader sunspot. Growth during next 3 days accompanied by major flare activity.
280	S10	2/3 2/4 2/10 2/6	Filament disappeared. Filament re-formed. Filament disappeared again near west limb. Birth of small active region.			2/24-25	Maximum development as complex class D spot group with "delta" magnetic configuration. Spot group to east moved to closest separation by this time. Major proton flare on 25 February occurred near point of contact between these two regions.
270	N13	2/10	Birth of moderate active region near west limb that attained small class E spot group before west limb passage 13 February. Formed within area of extensive plage of moderate intensity.	72	N20	2/19-20	Filament disappeared at north border of activity complex, as two small active regions emerged underneath the filament.
257	S19	2/7	Birth of small active region within faint plage.	70	S47 S60	2/17 2/17	Filament disappeared at east limb. Filament disappeared at east limb.
240	N10	2/9	Portion of large filament disappeared following formation of wave in filament and rearrangement of neutral lines previous day. Filament re-formed during remainder of disk passage. This filament, and filament portion, south and northeast, became especially large and active by west limb passage.	69	S13	2/19	Birth of small active region.
			Central meridian passage of large and active filament with orientation in latitude opposite the usual for large quiescent filaments.	68	N20	2/20	Birth of small active region that added only a minor addition to the great activity complex.
225	S13	2/10	Filament disappeared on same neutral line as filament disappearance of previous day at (170.S45).	65	N12	2/21	Important new growth of spots within existing group greatly enhanced activity within the center of this great complex.
205	S32	2/15	Filament disappeared simultaneously with filament southwest of this position.			2/25-26	Spots attained greatest size, and leader spots "collided" with complex group to the west. Spots in both areas greatly diminished by west limb passage 28 February.
203	S25	2/15	Filament disappeared simultaneously with filament southwest of this position.			2/28	Additionally minor proton event from large flare at west limb.
188	N17	2/12	Birth of moderate active region that reached maximum 14 February as class D spot group. Greatly diminished by west limb passage 19 February.	58	S20	2/19-20	Birth of very small active region.
			Filament disappeared.	55	S31	2/19-20	Large filament disappeared at east limb; re-formed by 25 February.
170	S45	2/14	Partial disappearance of filament.		N22	3/1	Birth of small bright region at west limb.
165	S26	2/14	Birth of small active region that maximized next day as small class D spot group.	48	N14	2/18	Possible date of birth at east limb of major active region at trailing end of great activity complex.
156	S11	2/16	Probable date of birth at east limb of moderate active region that developed following dominant class D spot group; it reached maximum size 17 February.			2/23	Maximum development as complex class D spot group with a high spot count.
125	S14	2/12	Birth of very small active region.	30	N18	2/25 2/27 2/28	Filaments bordering negative-polarity cell disappeared. Filaments re-formed. Filaments disappeared again.
123	S02	2/14	Birth of very small active region.	6	N26	2/26-27	Part of large filament disappeared.

Note: Days without H-alpha photographs were 8, 19 and 26 February 1969.

# H<sub>IV</sub> SYNOPTIC CHART

1969 - ROTATION 1544

# H $\alpha$ SYNOPTIC CHART 1969 - Rotation 1545

*Long.	*Lat.	Date	Descriptive Notes	*Long.	*Lat.	Date	Descriptive Notes
355	N40	2/28	CMP of especially large and active filament.	130	N13	3/15	region before resuming original position.
345	N25	3/1	CMP of especially large and dark filament.				Birth of small active region east of and slightly under a large dark filament. Plage visible through filament. Filament moved slightly west, then disappeared 2 days later.
342	S18	2/28	Maximum development of complex of two large spot groups that appeared to develop along a common meridian. A "delta" magnetic configuration developed near the center of the complex.	S15		3/20	New growth within large, complex remnant plage.
326	N21	3/1	Filaments disappeared.	S25		3/20	Filament disappeared.
315	N45	3/4-5	Filaments disappeared on eastern border of this negative-polarity bay.	105	N12	3/17	Plage and spot growth near large sunspot on its second disk passage, and leading one of great activity complexes of the solar cycle.
302	N14	3/6	Filament disappeared.	103	S08	3/16	Birth of small active region.
297	N/5	3/5	Plage growth and filament darkening.	95	N12	3/14	Birth at east limb of major active region that became complex class E, then F, spot group. An interaction between it and the major region immediately west formed the western half of this great activity complex. Spot group was follower-dominant.
285	N15	2/27	Probable date of birth at east limb of small active region in leading edge of large, faint plage.				CMP of extremely active filament.
272	N13	3/5	Birth of active region that developed class D spot group by 8 March. This group and one growing to the east coincided with large, proton-emitting limb flare. This area returned 2 weeks later as one of the largest spot groups of the solar cycle.	85	S06	3/20-21	Birth of active region that maximized 19 March as simple class D spot group.
266	N22	3/5	Filament within faint plage disappeared, in apparent response to growth of nearby active regions.	73	S26	3/17	Semicircular filament disappeared in apparent response to nearby growth of active regions.
265	N11	3/2	Birth of small active region.	72	S36	3/19	CMP of point of "collision" between two great sunspot groups. Leader spot of eastern region was especially large and dark, and it merged with follower spot of western region by 24 March. Great flares with proton emission occurred in this area on several days of the disk passage.
255	S36	3/10	Filament disappeared.	69	N20	3/22	Great west limb event presumably originated from this area. Notable for magnitude of eruptive prominence from a position at least 20° beyond the limb, for great expanding radio bursts, and for particles detected throughout the solar system for the next 2 weeks.
245	S25	3/7-8	Large filament disappeared in apparent response to active regions developing to the west.				Active filament disappeared.
210	N20	3/7	Birth of small active region.	67	N36	3/20	Filament re-formed.
205	N02	3/14	Filament disappeared. Formed boundary to vortical pattern surrounding sunspot to the north.			3/21	Filament disappeared again.
203	N43	3/10	Filament disappeared.	64	S11	3/23	New plage and spot growth on northern border of large spot in region on second disk passage.
201	N09	3/12	CMP of sunspot with strong counterclockwise vortical development of fibrils radial to the spot.	55	S32	3/16	Birth at east limb of small active region.
190	N16	3/15	Filament disappeared. Nearby sunspot showed accelerated dissolution after this date.			3/20	Rapid growth began; region reached maximum 23 March as follower-dominant class E spot group.
180	S28	3/13	CMP of large and especially active filament.	50	S12	3/25	Birth of small active region.
149	N23	3/15	Birth of small active region.	37	N10	3/27	Birth of very small active region near west limb.
148	N15	3/16	Filaments southeast of this point disappeared in apparent response to growth of nearby region.	22	S35	3/29	Part of filament disappeared near west limb.
132	N15	3/17	Large filament disappeared in response to growth of nearby active region. Re-formed next day in pattern such that neutral line looped through the new active	13	S11	3/25	Filament disappeared in apparent response to birth of small active region east of this position.
				7	S10	3/25	Birth of small active region.

Note: Days without H-alpha photographs were 7 and 22 March 1969.

# H $\alpha$ SYNOPTIC CHART 1969 - ROTATION 1545

H $\alpha$  SYNOPTIC CHART  
1969 - Rotation 1546

°Long.	°Lat.	Date	Descriptive Notes	°Long.	°Lat.	Date	Descriptive Notes
359	N26	3/28	Large filament disappeared, in apparent response to growth of small nearby active region.	112	S07	4/14	Significant new growth in center of mature and complex class D spot group that tripled its area. No basic change in configuration.
357	N22	3/27	Birth of small active region.	102	S27	4/17	Filament disappeared.
342	N23	3/29	Almost all of large filament disappeared.	95	N16	4/18	Filament within activity complex disappeared.
341	S10	3/31	Birth of tiny active region.	92	N38	4/15	Filament disappeared.
332	S10	3/28	Birth of moderate active region that reached maximum 30 March as rudimentary class C spot group with numerous spots.	90	S14	4/16	Birth of moderate active region that reached maximum 18-19 April as class D spot group with simple structure.
328	N10	3/27	Minor growth within small active region.	89	N05	4/11	Birth near east limb of moderate active region south of large sunspot that had returned for its third disk passage. New spots reached maximum 17 April and formed a complicated configuration in combination with the older active region.
325	N25	4/3	Large filaments on eastern border of large, positive-polarity bay disappeared near west limb. Intercomparisons of this area on rotations 1545-1548 suggest that the series of filament disappearances along this S-shaped neutral line may have been a consequence of the large difference in rotation rates between features north and south of the N25 latitude.	88	N19	4/13	Birth of moderate active region on northern border of large, remnant plage of great activity complex of previous solar rotation. Attained maximum 15 April as class D spot group.
303	N25	3/30	New growth of plage and spots north of leader spot of extended class C spot group.	86	N22	4/21	Birth of additional moderate active region within remnant plage of region born 13 April. Attained class C spot group this day; no significant growth noted 22 April at west limb.
275	N32	4/1	Filament disappeared.	82	N18	4/17-19	Small and very active absorption feature developed over neutral line between young spot group and remnant plage of older activity complex.
273	N10	4/2-3	Central meridian passage of one of the largest spot groups of the solar cycle. Notable for its slow rate of evolution and lack of major flares, in contrast to the rapid evolution of small spots on its previous disk passage and the great limb event of 12 March.	61	S19	4/17	Birth of small active region south of isolated sunspot with well-developed vortical fibril pattern and clockwise sense of twist.
248	N20	4/1	Birth of small active region at trailing end of large plage complex.	53	N27	4/21	Filament, associated with large sunspot on its third disk transit, disappeared with resulting major flare. No significant proton event followed this flare despite the proton-emitting history of this region on previous solar rotations.
245	N38	4/11	Small bright plage formed at west limb.	45	S19	4/17	Birth of small active region at trailing end of large activity complex.
222	S18	4/3	Filament disappeared.	44	S10	4/20	Birth of moderate active region at position of small plage present since east limb. Developed following dominant class C spot group with maximum on 22 April.
220	S11	4/7	Filament disappeared.	28	S39	4/24	Large portion of filament disappeared.
195	N09	4/8	Central meridian passage of large and very stable active region with large leader sunspot and few, very small follower spots.	10	S53	4/26	Filament disappeared near west limb.
179	N26	4/13	Birth of small active region near filament that disappeared when region emerged.	7	N03	4/19	Birth of tiny plage that disappeared by 23 April.
178	N30	4/10	Small filament disappeared.				
175	M15	4/13	Filament disappeared in response to birth of nearby active region.				
173	S13	4/6	Birth of small active region.				
161	N03	4/13	Equatorial filament disappeared.				
140	S40	4/18	Filament disappeared near west limb.				
135	N20	4/15	Large filament disappeared.				
123	S16	4/8	Birth at east limb of moderate active region that reached maximum 11 April.				

Note: There were no days without H-alpha photographs.

# H $\alpha$ SYNOPTIC CHART 1969 - ROTATION 1546

H $\alpha$  SYNOPTIC CHART  
1969 - Rotation 1547

°Long.	°Lat.	Date	Descriptive Notes	°Long.	°Lat.	Date	Descriptive Notes
360	N19	4/21	Birth of tiny plage that disappeared by 23 April.	150	N11	5/7	Filament disappeared; gradually re-formed during remainder of disk passage.
352	N08	4/25	Small filament disappeared.	136	S11	5/3	Probable date of birth of small active region 1 day before east limb appearance. Reached maximum 5 May as class C spot group.
335	N10	4/25	Birth of small active region. Combined with nearby region to southeast to form plage with embedded filament by 28 April.	130	S39	5/15	Filament disappeared.
333	N40	4/24	Filament disappeared; re-formed after 26 April.	126	S30	5/4	Birth at east limb of small active region.
331	N08	4/22	Birth of small active region.	123	Equator	5/8	Small filament disappeared.
330	N29	4/25	Filament disappeared, completing the disappearance of all filaments bordering this high latitude, negative-polarity feature. A similar series of filament disappearances occurred surrounding this same feature on the previous solar rotation. Re-formed after 26 April.	113	N10	5/12	Birth of small active region.
325	S31	4/24	Filament disappeared.	108	S10	5/13-14	Large filament formed within large filament channel.
311	N20	4/23	Filament disappeared.	107	N08	5/10	Birth of small region within extensive faint plage and on large-scale, equator-crossing neutral line.
308	S26	4/26	Filament disappeared from within faint plage.	100	S05	5/11	Birth of moderate active region in position of very small plage visible since east limb passage 4 days earlier.
303	S20	4/29	Filament near faint plage disappeared.		N13	5/14	Second growth phase, maximizing next day as class C spot group.
295	N12	4/23	Probable date of birth of small active region at leading edge of large returning region.			5/15	Filament formed between developing active regions this day only.
278	N08	4/27	New growth began.	98	N18	5/14	Birth of moderate active region that reached maximum 16 May as class D spot group.
272	N18	4/28	Small peninsula of positive polarity became isolated from principal neutral line within large remnant of the great region of previous rotation.	95	N12	5/13	Birth of moderate active region that reached maximum 16 May as class D spot group.
269	S20	5/4	Filament formed within remnant plage of very large active region of previous rotation.	80	N18	5/10	Birth at east limb of moderate active region within remnants of a great activity complex completing its second disk transit.
250	N06	5/1-2	Filament disappeared at west limb.	77	N13	5/15	Large and dark filament formed within large bright plage that lay between two mature, active regions.
242	S20	5/4	Birth of very small active region.	71	N15	5/10	Birth near east limb of moderate active region within remnant of great activity complex.
237	N11	5/4-5	Central meridian passage of large, dark filament.	55	S41	5/15	Filament disappeared.
236	N10	4/30	Birth of small active region, in position of faint plage from region born 30 April.	50	S68	5/15	Large filament, disappeared near east limb.
216	N18	4/28	Birth of very small active region.	44	N18	5/17	Birth of small active region.
195	S48	5/1	Birth at east limb of small active region.	42	N33	5/20	Large, active filament disappeared at west limb.
183	N36	5/3	Filament disappeared near east limb.	26	S23	5/13	Birth of very small active region.
173	S11	5/4	Filament disappeared near east limb.	08	S39	5/22	Filament disappeared.
170	S22	5/9	Large filament formed.	03	S30	5/24	Filament disappeared.
			Maximum development of class E spot group.				
			Filament south of large active region disappeared, as new small region formed near trailing edge of the region.				
169	S18	5/9	Birth of small active region near trailing plage of large active region.				
168	S45	5/6	Large filament disappeared near east limb.				

Note: There were no days without H-alpha photographs.

# H $\alpha$ SYNOPTIC CHART 1969 - ROTATION 1547

# H $\alpha$ SYNOPTIC CHART 1969 - Rotation 1548

*Long.	*Lat.	Date	Descriptive Notes	*Long.	*Lat.	Date	Descriptive Notes
358	N08	5/21	Large filament disappeared in response to growth of active region nearby.	172	S15	6/1	Several small filament fragments disappeared from boundary of large cell. Faint region with small leader sunspot was situated on western border of cell.
357	S12	5/20	Birth of small active region.			6/6	Several small new areas of plage formed within the faint plage.
351	N13	5/21	Birth of small active region associated with disappearance of large filament. This new region and another to the southeast produced major changes in this area's large-scale magnetic pattern.	S10		6/3	Birth of small active region within old faint plage.
348	N05	5/23	Birth of moderately small active region that developed class C spot group.	S10		6/2-3	Formation of additional area of faint plage on northern boundary of extensive faint region.
340	S19	5/21	Birth of moderately active region that evolved complexly.	117	S35	6/10-11	Filament disappeared.
		5/24	First maximum development as class E spot group.	115	N09	6/5	Birth of major active region within moderately bright and complex older plage.
		5/26	Important additional spot growth in following portion, as merger took place with complex group to the southeast. "Delta" magnetic configuration continued to west limb 28 May.			6/9	Maximum development of class E spot group with numerous surrounding small spots in the older plage. Formed leading member of a great activity complex, which was regenerated for a fifth consecutive disk transit.
339	S12	5/17	Birth of major active region near east limb.	107	S12	6/9	Birth of small active region in trailing portion of faint plage.
336	S21	5/22-23	Maximum development as large class E spot group.	90	S14	6/3	Probable date of birth at east limb of great active region that developed compact class F spot group by 9 June. Growth continued until 13 June, when the area exceeded 1500 millionths of a solar hemisphere.
332	S39	5/22	Birth of tiny plage.		N11	6/7	Maximum development of class F spot group notable for neutral line encircling the large leader sunspot. Bright plage occurred mostly in the area of follower-polarity, forming an outer border to the circular neutral line. This plage gave the appearance of a bow of encounter between this region and the other, fainter region to the west.
325	N10	5/19	Birth of moderate active region that reached maximum development 23 May as class D spot group with many spots.				Maximum development of great, complex, single spot with accompanying plage almost totally confined to the following portion of the region. Only after decay of the spot did plage develop on the western side of the neutral line; it became visible after central meridian passage 11 June.
323	S22	5/19-28	Filament bordering important active region especially active throughout its disk passage.	73	N18	6/8	Birth of small active region that developed small class D spot group by 15 June.
315	S26	5/21	Filament disappeared; re-formed 24 May.			6/13	Birth of small active region that merged with region to the south.
294	S29	5/27	Filaments bordering small positive-polarity cell partially disappeared.	23	N23	6/15	Birth of small active region near east limb.
		5/25	Filaments completely gone.	21	N04	6/10	Birth of small active region near east limb.
287	S17	5/30	Birth of small active region near west limb.	18	N10	6/20	Birth of small region at west limb.
280	N12	5/28-6/1	Filament especially dark last 4 days of disk passage.	9	N05	6/18	Small filament disappeared.
274	N13	5/27	Central meridian passage of spot and large faint plage -- a region that was on its fourth disk passage and one that had been active during the previous three solar rotations. Sunspot returned 4" higher in latitude than previous disk transit.				
256	N02	6/1	Filament disappeared.				
243	S30	5/26	Small filaments disappeared.				
235	S15	6/2-3	Filament disappeared.				
214	S12	5/27	Birth of tiny active region.				
200	S65	6/2-3	Filaments disappeared.				
198	N12	5/28	Small filament disappeared near east limb.				

Note: Day without H-alpha photographs was 2 June 1969.

# H<sub>α</sub> SYNOPTIC CHART

1969 - ROTATION 1548

# H $\alpha$ SYNOPTIC CHART 1969 - Rotation 1549

°Long.	°Lat.	Date	Descriptive Notes	°Long.	°Lat.	Date	Descriptive Notes
352	N15	6/21	Birth of small active region near west limb.	125	S35	7/3	Birth of small active region.
328	S10	6/15	Birth of small active region that had disappeared by 19 June.	S11	7/6		Filament especially large from this date to west limb passage 10 July.
325	N08	6/18	Birth of moderate active region on southern border of large region returned from previous disk passage. The two regions were aligned so as to share a common neutral line and to have leader sunspots along single meridian.	103	N08	6/30	Probable date of birth at east limb of small active region near remnant of the great activity complex of previous five solar rotations.
323	N03	6/19	Birth of small region on southern border of region that had formed previous day. It shared the same neutral line as the two regions north of this position.	92	S10	7/10	Birth of small plage at northern border of great region on second disk passage. This plage gradually brightened during west limb passage 13 July.
319	S12	6/24	Birth of small active region just before west limb passage.	91	S14	7/7	Central meridian passage of great spot group that returned for second disk transit. This passage marked by extraordinarily large and complex leader spot with a high count of small attendant spots. Appreciable decay after crossing central meridian.
296	N02	6/23	Birth of small active region.		7/8		Additional spots in following portion of region.
288	S17	6/24	Birth of small active region.		7/11-12		Important new spots formed in following portion C. region last 2 days of disk passage.
265	S22	6/30	Birth of small active region at west limb.	40	N14	7/15	Birth of small new region within leader portion of faint plage. Growth continued to west limb passage 17 July.
252	S20	6/22	Birth of small active region.	36	S08	7/8	Birth of small active region.
240	N08	6/23	Birth of small active region.	N18	7/16		Filament disappeared near west limb, in response to growth of nearby active region.
210	N16	6/28	Birth of small active region within faint plage.	33	S15	7/8	Filament disappeared, in apparent response to birth of small active region nearby.
	N41	6/29	Large filament disappeared.	31	N23	7/13	Part of filament disappeared.
183	S17	7/2	Birth of moderate active region on neutral line common with complex pair of regions to north of this location. Maximum development 3-4 July as large class C spot group.	30	N34	7/8	Portion of large filament disappeared.
				N22	7/12		Birth of tiny plage near filament.
178	S10	6/30	Maximum development of large class D spot group that grew slowly from east limb on 24 June.	10	N20	7/12	Birth of active region that formed in faint plage and reached maximum 14 July as class D spot group.
175	S11	7/1	Birth of small active region on trailing border of moderate active region with which it merged, forming a complex active area. Maximum development 3 July.				
165	S30	7/2	Filament steadily enlarged from this date to west limb passage 7 July.				
150	S09	7/1-2	Pair of filaments on convoluted portion of neutral line disappeared, as if the line simplified in form.				
149	N20	6/30	Birth of small active region with class C spot group.				
144	S20	7/5	Filament disappeared; re-formed next day in larger form.				

Note: There were no days without H-alpha photographs.

"Long.	"Lat.	Date	Descriptive Notes	"Long.	"Lat.	Date	Descriptive Notes
352	N16	7/17	Birth of tiny plage.	133	N12 S05	7/29 8/2	Small filament disappeared. Large filament disappeared that bordered field of filaments emanating from great active region.
350	S16	7/10 7/17	Birth of small active region. Neutral line rearranged to join with filament channel east of region.	126	S12	7/31	Birth of major region on southern border of major active region. Merged immediately with older spots to form a great sunspot group.
345	N15	7/13	Filament disappeared.	124	S08	7/25-26 7/31	Probable date of birth of major active region at east limb. Maximum development as compact class D spot group with complex structure.
332	N13	7/16	Birth of small region near northern edge of large leader sunspot on its third disk passage.	118	N13	7/31	Birth of moderate active region that reached maximum 4 August as class D spot group with large leader spot.
330	S15	7/16	Filament disappeared within faint plage.	115	N05	7/31	Birth of small active region. Developed brilliant plage containing small class C spot group by 2 August, but quickly dissipated.
310	N25	7/18	Birth of small active region. Neutral line was incorporated into large filament channel to north by next day. Followed dominant spot group.	70	N29 N26	7/31 8/12	Part of filament disappeared at east limb. Large filament disappeared at west limb.
302	S16	7/20	Birth of small active region.	66	S12	7/30	Probable date of birth at east limb of large active region that reached maximum 2-3 August as class E spot group.
280	S50	7/24	Filaments bordering large cell disappeared near west limb.	65	N08	8/9	Birth of new small region within center of old faint plage.
275	N07	7/20 7/24	Birth of tiny plage; disappeared 22 July. New plage growth.	54	S17	8/6	Birth of small active region at trailing end of faint plage.
273	N10	7/25	Birth of small active region near west limb.	51	S22	8/1 8/7 8/9-12	Birth of active region that reached maximum by 5 August as class C spot group with large leader spot. Additional small spots formed; leader no longer large. Spot growth and plage brightening during last 4 days of disk passage made region increasingly complex.
265	N23	7/24	Part of large filament disappeared.	26	N25	8/10	Filament formed for 2 days, then disappeared.
240	N10	7/19	Maximum development of small, follower-dominant class D spot group.	11	N15	8/3	Birth of small active region at east limb within extensive area of faint plage.
220	N02	7/27	Small filament disappeared.	5	S32	8/8	Birth of small active region that reached maximum 11 August as class D spot group.
210	N37	7/23	Filament disappeared.				
206	N12	7/22	Birth of small active region.				
205	N03	7/22	Filament disappeared, in apparent response to birth of small region nearby.				
203	N17	7/28-31	Large filament developed north of active region.				
190	N27	7/30	Birth of small active region.				
178	S15	7/30	Birth of small active region within large, complex and faint plage.				
170	S25	7/28	Curved filament disappeared with resultant flare in faint plage at S18. Possibly related to emerging new region at (178, S15).				
160	N13	8/1	Birth of very small active region.				
150	S16	7/27-28	Minor new growth, in mature, active region with complex class C spot group and double leader spot.				

Note: There were no days without H-alpha photographs.

1969-1970 - Rotation 1556

*Long.	*Lat.	Date	Descriptive Notes	*Long.	*Lat.	Date	Descriptive Notes
355	S08	12/21	Birth of small active region.	98	S11	1/8	Birth of active region near east limb that grew to maximum by 12-15 January as class D spot group.
345	S01	12/25	Maximum development of region with class C spot group.	96	N09	1/10	Birth of very small plage within extensive faint plage.
342	S21	12/21	Birth of active region near east limb with slow initial growth.	95	N16	1/18	Birth of small region near west limb within extensive faint plage.
330	S07	12/25	Maximum development as class D spot group.	92	S16	1/12	Birth of active region that grew to maximum by 14 January as small class C spot group.
321	N10	12/25	Birth of active region with maximum development near west limb on 31 December as follower-dominant class D spot group.			1/16	New growth simultaneous with rapid development of new region a few degrees south of this location.
320	S35	12/26-30	Large filament disappeared.		S20	1/16	Birth of class D spot group that blended with older small region north of this location. Began to decline next day. The addition of this region formed a complex of three active regions joined by a common neutral line lying approximately north-south.
287	S18	12/26-27	Birth of active region that grew to maximum by 31 December as large class D spot group.				
275	S08	1/3	Filament disappeared.	74	S13	1/12	Birth of active region between, and overlapping, two faint active regions. New region grew to maximum next day as small class D spot group.
256	N20	1/5	Large curved filament disappeared.	70	S42	1/17	Filament disappeared.
241	N12	12/27	Probable date of birth of active region near east limb that grew to maximum by 2-5 January as large class D spot group.	67	S22	1/18	Active filament disappeared on southern border of activity complex.
240	N30	1/5	Filament disappeared.	66	N23	1/20	Part of filament disappeared near west limb.
229	N10	12/27	Probable date of birth of small active region near following edge of large active region.		S23	1/20	Birth of active region that grew to class D spot group by next day. Just before west limb passage. This region was fourth in a series to form on the same neutral line.
221	S08	1/1-2	Filament disappeared.	55	S22	1/20	Filament disappeared in apparent response to birth of nearby active region.
211	N30	1/6	Partial disappearance of filament.	50	S11	1/14	Maximum development of large, follower-dominant class D spot group on common neutral line with small class D spot group 5° to the south.
195	N03	1/6	Filament partially disappeared; western portion re-formed next day.	42	S14	1/17	Birth of active region near large follower spot of class D spot group. Grew to maximum by 21-22 January as large class D spot group that crowded into the complex of regions to its west.
185	S03	1/9	Filament disappeared.	20	N16	1/18	Maximum development of simple, large class E spot group.
180	N21	1/10	Birth of small active region in following portion of very faint plage.		S26	1/20	Large filament disappeared.
179	S29	1/8	Filament disappeared.	5	N05	1/22-23	Active filaments disappeared.
170	N10	1/3	Birth of active region near convolution in large-scale filament channel. Grew to maximum by 12 January near west limb as class E spot group in bright plage.				
168	S18	1/6	Filament disappeared.				
158	S38	1/10-11	Filament disappeared in apparent response to growth of nearby active region.				
148	N19	1/12	Filament disappeared from southern border of faint plage.				
114	S08	1/8	Birth of active region near east limb; maximized by 13 January as small class D spot group with numerous spots.				
113	S22	1/10	Filament disappeared in apparent response to growth of nearby active region.				
99	N04	1/18	Birth of small region near west limb.				

Note: Days without H-alpha photographs were 24 and 26-29 December 1969 and 1 January 1970.

# H<sub>α</sub> SYNOPTIC CHART

°Long.	°Lat.	Date	Descriptive notes	°Long.	°Lat.	Date	Descriptive Notes
347	S15	1/26	Small filament disappeared.	165	S18	1/30	Probable date of birth near east limb of active region that grew to maximum by 2 February as class C spot group with group axis inclined to solar equator at steep angle. The large-scale neutral line through the region was oriented northeast-southwest, opposite to normal for Southern Hemisphere large-scale patterns. Birth of tiny plage.
295	S10	1/23	Birth of active region that grew rapidly to class S14 as class D spot group.				
	S14	1/24	Birth of major active region that grew rapidly to class E spot group by 28 January. Formed between large complex of two aged regions and a strong, growing region to form series of four regions centered on a common neutral line and arranged nearly on a common meridian. This great spot group had rapid proper motions of small spots that coalesced to form the large leader and follower spots.	N22	2/3		Birth of small active region.
			Filament gradually disappeared.	162	N13	2/3	Filament disappeared.
275	S14	1/28-29	Birth of second region of activity complex. Grew to class D spot group by next day.	155	S35	2/1	Small filament disappeared.
270	S08	1/25	Probable date of maximum development for large class D spot group around which developed large complex of active regions during the disk passage.	154	S22	2/3	Birth of small active region.
263	S02	1/24	Birth of active region on southern border of activity complex. Grew to maximum by 31 January as class D spot group.	145	S08	2/3	Birth of small active region at position of small faint plage.
260	S07	1/27	Birth of active region near eastern border of activity complex. Grew to maximum by 28 January as class C spot group.	143	N04	2/5	Second period of minor growth near west limb.
256	S04	1/26	Birth of small region with single spot. Spot and plage gone next day.	141	S11	2/10	Birth of active region at trailing border of small faint plage, grew to maximum by 7 February as class D spot group with exceptionally steep angle of inclination for the group axis. Neutral line oriented east-west instead of normal northwest-southeast. Polarity reversed from normal for Southern Hemisphere. Filament disappeared.
252	N19	1/31	Birth of active region that grew to maximum by 1 February with class B spot group.	135	N31	2/8	Birth of tiny plage.
251	S19	1/30	Large filament disappeared.	125	S01	2/5	Probable date of birth near east limb of small active region with irregular slow development.
250	N39	1/29	Birth of active region that grew to maximum by 2 February with follower-dominant class D spot group.	114	S10	2/3	Embedded filament disappeared.
235	N19	1/31	Filament disappeared in apparent response to growth of active region northwest of this position.	102	S13	2/7	Minor growth in faint plage.
232	N10	2/1	Probable date of birth at east limb of active region that grew to maximum by 30 January with follower-dominant class C spot group.	90	N19	2/7	Birth of major region centered on old active region that had crossed east limb with a single, small leader spot. Rapid growth to maximum by 11-12 February as exceptionally complex class E spot group. Filament disappeared.
224	N12	1/25	Birth of small active region.	70	S13	2/10	Birth of active region that grew to maximum by 12 February as a large, follower-dominant class D spot group. Formed between two faint plages that were attended by a large sunspot.
209	S16	1/30	Circular filament disappeared.	63	N16	2/14	Birth of small active region.
200	N25	2/3	Birth of small active region.	40	S03	2/8	Probable date of birth at east limb of small active region.
191	S02	2/3	Birth of active region that grew to maximum by 7 February as class C spot group.	38	N17	2/17	Filament disappeared in apparent response to birth of nearby active region.
189	S10	2/1	Northern portion of large curved filament disappeared and southern portion enlarged near west limb.	33	S01	2/7	Small filament disappeared.
178	N30	2/6	Small filament disappeared within faint plage.	29	N21	2/17	Birth of active region that grew to maximum by 18 February with class C spot group.
168	S27	2/3		5	S19	2/14	Filament disappeared in apparent response to growth of nearby region. Flare occurred with the disruption.

Note: There were no days without H-alpha photographs.

# H<sub>α</sub> SYNOPTIC CHART

1970 - ROTATION 1557

# H $\alpha$ SYNOPTIC CHART 1970 - Rotation 1558

Long.	Lat.	Date	Descriptive Notes	Long.	Lat.	Date	Descriptive Notes
360	S11	2/10	Probable date of birth at east limb of active region that reached its first maximum on 14 February as class D spot group with numerous spots.	192	S03	2/25	Birth of active region near east limb that grew to maximum by 27 February as class D spot group. Formed northern member of complex of three minor regions.
		2/18-19	Additional growth enlarged the group to class F with rudimentary penumbra and an exceptionally large spot count.	174	N05	2/25	Probable date of birth at east limb of small active region.
338	S22	2/15	Maximum development of simple class E spot group with large leader and follower spots.	155	N07	3/3	Maximum development of class E spot group. Large spot that formed near region's center moved westward and merged with initial leader spot to form exceptionally large spot by this date.
330	S05	2/17	Small filament disappeared.	145	S25	3/6	Filament disappeared.
315	N20	2/20	Filament disappeared in apparent response to birth of nearby active region.	140	S20	3/7	Birth of small active region that grew to maximum by 10 March as small class D spot group.
311	N11	2/20	Birth of active region that reached maximum next day as small class C spot group.	125	S40	3/7	Filament disappeared.
310	S40	2/17	Filament disappeared near east limb.	123	S23	3/7	Birth of small active region.
295	N12	2/21	Large filament disappeared in response to birth of active region near northern end of filament. Re-formed and remained active after 23 February.	122	S10	3/7	Birth of small active region at location of leader spot of old region. New spots and diminishing old spot became indistinguishable by next day. New region attained maximum by 9 March as small class D group.
292	S24	2/22	OMP of large active region in which an outstanding example of neutral line rearrangement occurred. On 22 February a convoluted portion of the line formed a small cell, isolated from the main neutral line.	121	N01	3/3	Filament disappeared; re-formed next day.
290	N22	2/21	Birth of active region near large filament channel.	116	N07	3/8	Filament disappeared again.
275	N11	2/23	Grew to maximum by 24 February as class D spot group.	113	S14	3/5	Small circular filament disappeared.
270	S06	2/22	Filament disappeared.	80	S13	3/4	Birth of active region that grew to maximum next day as small class C spot group.
		2/22	Birth of active region near leader spot of complex of two aged regions. Grew to maximum by 25 February with complex, embedded absorption features and class D spot group.			3/11	East limb passage of mature class E spot group with large leader spot.
265	N20	2/19	Birth of active region at east limb that grew rapidly to class D spot group by 21 February and attained maximum area by 24 February.	75	S07	3/12	Birth of new spot group within northern portion of region and centered on existing neutral line. New spots developed to compact class D by 12 March and decayed rapidly before west limb passage.
		2/20	Filament disappeared with resulting parallel-ribbon flare; re-formed same day and gradually enlarged throughout remainder of disk passage.	70	N30	3/12	Filament disappeared.
252	N37	3/1	Filament disappeared near west limb.	30	N13	3/11	Great filament disappeared.
251	N10	2/26	Birth of small active region.	23	S10	3/18	Birth of small active region.
238	N16	2/24	Maximum development of complex class E spot group; evolved rapidly throughout its disk passage.	18	S01	3/12	Filament disappeared.
		3/1	Important new growth near follower spot continued through west limb passage, creating "delta" configuration with steep magnetic field gradient. Proton flare occurred on 6 March from beyond the limb, followed by a great magnetic storm on 8 March.			3/18	Birth of active region that grew to maximum area by 15 March as small class D spot group. Leader spot became especially dark and symmetric after 15 March.
207	S19	3/7	Small region formed at west limb.			3/20	Plage developed to encircle leader spot.
203	S13	3/2	Birth of small active region.	12	N40	3/14	Large active filament developed south of the region near west limb.
196	N50	2/28	Filament disappeared.				Great filament disappeared.
195	N25	3/6	Almost all filament bordering this cell disappeared				

Note: There were no days without H $\alpha$  photographs.

1970 - ROTATION 1558

H $\alpha$  SYNOPTIC CHART  
1970 - Rotation 1559

"Long.	"Lat.	Date	Descriptive Notes	"Long.	"Lat.	Date	Descriptive Notes
345	N20	3/12 3/18	Birth of small active region near east limb. Circular filament enclosing follower polarity disappeared. New active region formed nearby on same day.	225	N20 N39	3/25 3/29	Birth of small active region near a leader spot. Filament bordering northern edge of large-scale cell disappeared.
335	N17	3/18	Birth of active region that grew to class E spot group by 23 March near west limb.	220	N20	3/29	Birth of small active region within faint plage and at eastern edge of small complex of two small regions.
312	S49	3/19	Filament disappeared.	217	N25	3/27-28	Circular filament within faint plage disappeared, in apparent response to growth of nearby active region.
310	N20	3/18	Filament disappeared.	195	S12	4/1	Birth of small active region in northern portion of large, faint plage.
294	N38	3/21	Filament disappeared.	189	S02	3/28	Birth of new active region in center of small plage with small leader spot. New region grew to maximum by 30 March as small class D spot group. Original leader spot disappeared as new spots reached maximum.
277	S08	3/23	Birth of small active region within extensive area of faint plage.	173	N03	3/31	Birth of active region in center of small faint region. New region grew to maximum by 2 April as class D group with small spots.
268	S15	3/24	Filament disappeared from area of faint plage; re-formed by 26 March.	172	S13	3/29	Filament formed same day as disappearance of filament nearby. Very active for remainder of disk passage.
264	S03	3/24	Birth of small active region near northwest edge of large single spot.	165	N20	3/30	Filament disappeared in apparent response to major re-arrangement of underlying neutral lines. Re-formed after 2 April closer to large region south of this location.
262	N17	3/24	Significant diminution of leader sunspot on same day as disappearance of filament that had pointed to this spot during the previous 5 days of disk transit. Filament channel beneath the filament clearly re-arranged after this date, indicating disappearance of that portion of the neutral line near the spot.	160	S20	3/29	Filament disappeared; partially re-formed after 1 April.
260	S34	3/26	Large filament disappeared.			4/5 3/31	Disappeared again near west limb. Birth of new region precisely on neutral line following large sunspot that was surrounded by outstanding counterclockwise vortical fibril pattern. New spots formed peculiar class C group very near the old spot by 2 April. Both old and new spots diminished rapidly before west limb passage.
256	N19	3/20	Birth of major active region within old plage with small leader spot. Grew in a complex fashion to maximum by 23 March as class E spot group. Overlapped with significant region south of this location to form large activity complex.			4/3	Filament disappeared in apparent response to rearrangement of underlying neutral line.
255	N10	3/23	Maximum development of simple class D spot group that grew simultaneously with large region on its northern border. Appeared as new growth within small region visible at east limb passage.	145	S10	4/3	Partial disappearance of large filament.
242	N20	3/24	Filament disappeared within major activity complex.	130	N18 N10	4/3 4/6	Birth of small active region.
238	N14	3/23	Beginning of new growth within remnant of proton flare region of 6 March. Developed follower-dominant class D group with maximum on 25-26 March. Notable for small, circular neutral line encircling large follower spot; for proton flare on 29 March; and for reversed polarity arrangement.	91	S09	4/8	Birth of active region with rapid growth to maximum as large class D spot group next day. Group axis inclined at negative angle, i.e., leader spot lay at higher latitude than followers.
230	S12	3/26 3/29	Birth of small active region with slow initial growth. Rapid growth to small class D group.	90	N18	4/6	Birth of active region within extensive area of faint plage and near very active filament. Grew to maximum by 8-9 April as reversed-polarity class D spot group with unusually steep inclination of group axis to solar equator.

Note: There were no days without H-alpha photographs.

1970 - ROTATION 1559

H<sub>α</sub> SYNOPTIC CHART  
1970 - Rotation 1559 (Continued)

*Long.	*Lat.	Date	Descriptive Notes	*Long.	*Lat.	Date	Descriptive Notes
87	S12	4/1	Maximum development near east limb of complex of three active regions. Two large symmetric spots, returned from previous disk passage, plus a small class D group to the north and between the large spots formed the complex.	6	N17	4/14	Birth of a third region near southern edge of leader spot. Maximum growth of these spots on 16-17 April, just before west limb passage.
70	S20	4/10	Birth of small active region in following portion of extensive, faint plage. (Position in error on synoptic chart).				
67	M19	4/4	Maximum development of simple class D spot group.				
61	M08	4/12	Filament disappeared near complex active region.				
53	S12	4/2	East limb passage of class F spot group with very large leader and follower spots and with appearance of younger, class D spot group superposed on the northern border of the region, much like the region at (87, S12). The spots on the northern border of the region emerged, disappeared and moved rapidly from day-to-day, tending to dissipate by 9 April. Major new region formed north of the great leader spot, giving the appearance of a rejuvenation of the spots discussed above. This third superposed group reached maximum on 11 April as compact class D.				
	M11	4/4	Birth of active region that grew to maximum by 11 April as compact and complex class D spot group. Became complex through emergence of additional bipolar areas north of the original spots on 8 April and south of the original spots on 10 April.				
46	S36	4/4-5	Small spots visible these days only, in small plage at exceptionally high latitude for this part of solar cycle. (Latitude in error on synoptic chart).				
36	M02	4/12 4/14	Active filament formed. Filament disappeared.				
26	S02	4/11 4/14	Filaments disappeared from within faint plage following single, symmetric sunspot. Re-formed next day. Filament became large and dark this day only.				
18	M11	4/15	Filament formed just before west limb passage.				
6	M17	4/7	Probable date of birth near east limb of active region that grew to initial maximum by 10 April as class E group. Large rate of divergence of leader from follower spot.				
		4/9 4/11	Dark surge emanated from leader spot. Birth of new spots in center of region, forming a group within a group. New leader moved westward relative to surrounding spots until it merged with original leader spot to form exceptionally large spot.				

Note: There were no days without H-alpha photographs.

# H $\alpha$ SYNOPTIC CHART 1970 - Rotation 1560

*Long.	*Lat.	Date	Descriptive Notes	*Long.	*Lat.	Date	Descriptive Notes
332	N09	4/13	Small filament bordering faint plage disappeared.	175	S10	4/28	Active filament disappeared in apparent response to birth of nearby active region.
327	N10	4/16	Birth of small active region within small faint plage. Grew to maximum next day as small, follower-dominant class C spot group.	164	N16	5/2	Birth of small active region near west limb.
320	S08	4/11	Birth of active region that grew to maximum by 14 April as small class D spot group. Formed precisely on long-lived, large-scale neutral line that was visible late in the disk passage as a long filament.	162	S17	4/28	Birth of active region within small faint plage. Grew to maximum by 1 May as small class D spot group.
293	N21	4/14	Filament disappeared near east limb.	155	S30	4/29	Filament disappeared in apparent response to growth of nearby active region; re-formed as large, active feature on 1 May.
290	N25	4/21	Active filament to the east of this position and large filament to the west disappeared on the same day, probably as part of rearrangement of neutral lines as large-scale areas of negative polarity merged (see rotation 1561 at this location).	N09		4/28 5/2	Birth of small active region. New growth with maximum next day as class C spot group near west limb.
279	N01	4/21	Birth of active region that grew to maximum by 24 April as follower-dominant class E spot group near west limb.	135	N19	4/23	Probable date of birth at east limb of active region with exceptionally slow and long period of growth. Reached maximum by 2 May as class E spot group.
276	N17	4/19	CMP of small single sunspot that was unusually far from plage or neutral line.	130	N29	4/29-5/1	Filament gradually disappeared as nearby active region grew to maximum.
265	N18	4/19	Birth of small active region within extensive faint plage.	127	N10	4/25	Birth of small active region near east limb.
		4/26	Region brightened at west limb as if new growth occurred.	121	N09	5/1	Minor plage and spot growth in following and southern portion of active region with single large leader spot.
250	S10	4/25	Filament disappeared near west limb.			5/5	Birth of new region in following portion of region, creating spot group next day with double leader spots, one of which was original spot.
233	N20	4/19 4/21	Filament disappeared; re-formed next day. Filament disappeared.	117	N23	5/5	Filament partially disappeared.
231	N10 S10	4/23 4/20	Birth of small active region. Birth of active region that grew to maximum by 22 April as follower-dominant, small class D spot group. Additional spot growth created complex configuration.	112	S07	4/28	Maximum development of small class D spot group between two larger regions. Spots rapidly dissipated after flare in this area next day. No evidence of the region by 4 May.
219	N21	4/23-24 4/21	Maximum development of small class C spot group with two leader spots.	107	S10	4/29	Maximum development of class D spot group that formed eastern member of activity complex.
218	S55	4/27	Filament disappeared.	94	S11	5/4	Birth of small active region within area of extensive faint plage.
215	N25	4/20	Filament disappeared on northern border of growing active region.	81	N16	5/9	Birth of small active region near west limb.
193	N10	4/24	Birth of small active region within small faint plage.	75	S19	5/8	Birth of small active region near site of single spot which had disappeared just hours before. That spot had returned from previous disk passage.
188	N03	4/27	Birth of small active region that disappeared by 29 April.	70	N28	5/5	Great filament disappeared after becoming elevated from neutral line on previous day.

Note: There were no days without H-alpha photographs.

# H $\alpha$ SYNOPTIC CHART

1970 - ROTATION 1560

H $\alpha$  SYNOPTIC CHART  
1970 - Rotation 1560 (Continued)

°Long.	°Lat.	Date	Descriptive Notes
69	S22	5/2-6	Filament formed within plage near large sunspot and moved vertically during this period to a very great height above the neutral line. This feature appeared to move across the sunspot and was last seen at longitude 74°.
60	S12	5/5-6	CHP of very large single sunspot that formed a giant bipolar pair with a great sunspot of equal size at (56, 2). These spots of opposite magnetic polarity shared the same neutral line. They had formed on the previous disk passage at nearly the same time and had reached their maximum development on the same day (see notes for rotation 1559). The large-scale +/- boundary with which they were associated was the solar source of a long-lived interplanetary sector boundary of the same polarity.
59	N05	5/6	CHP of exceptionally active filament.
56	N12	5/6	CHP of northern member of giant bipolar pair of spots. This spot was partially encircled by a very active filament and was surrounded by an outstanding example of vortical fibril pattern with counterclockwise sense of twist. Faint plage and small spots formed intermittently near the large spot throughout the disk passage.
55	S28	5/3	Filament disappeared.
53	S17	5/6	Filament disappeared from within large, faint plage. Re-formed to become large filament by 10 May near west limb.
36	S04	5/8	Birth of small active region.
22	S27	5/10	Birth of small active region.
15	N26	5/8	Filament associated with large active region disappeared; re-formed next day.
		5/10	Filament disappeared again; re-formed gradually during next 3 days.
10	S28	5/12	Filament disappeared.
9	S07	5/9	Birth of small active region.
5	N17	5/7	Maximum development of unusual, large class E spot group. It apparently developed as two superposed groups, forming two leader spots separated by 5° of longitude. A small third group emerged on the south-east corner of the complex.

Note: There were no days without H-alpha photographs.

H<sub>α</sub> SYNOPSIS CHART  
1970 - Rotation 1561

*Long.	*Lat.	Date	Descriptive Notes	*Long.	*Lat.	Date	Descriptive Notes
357	S11	5/9	Birth of small active region.	165	N16	5/28	Active filament disappeared.
333	S33	5/10	Filament disappeared.	161	S02	5/23	Filament disappeared in apparent response to birth of nearby active region.
323	N08	5/15	Filament disappeared.	158	N22	5/27	Filament disappeared within faint plage.
317	N09	5/10	Birth of small active region.	156	S14	5/22	Birth of active region that grew to maximum by 26 May as compact class D spot group.
303	S09	5/10	Birth of active region near east limb that grew to maximum by 15 May as compact, complex class E spot group. Formed on long-lived neutral line that had been site of a number of significant regions during the previous solar rotations.	151	N19	5/30	Birth of small active region within faint plage near west limb.
	S15	5/16	Birth of yet another region on this long-lived neutral line, forming due south of great active region which was at its maximum development. New region grew to maximum by 29 May as class D spot group, just before west limb passage.	145	S17	5/22	Birth of small active region that dissipated rapidly during next 2 days.
				133	S08	5/23	Birth of active region near east limb and near northern edge of small returning leader spot. New group grew in complex manner, forming compact class D spot group by 24 May with group axis steeply inclined to equator. Growth continued until 30 May when group was class E.
297	N19	5/11	Maximum development of simple, class D spot group.	124	N20	5/28	Birth of active region in following portion of large, faint plage. Grew to maximum by 1 June as simple class D spot group. Arc of bright plage formed west of leader spot where it moved into area of faint plage.
288	S13	5/14	Filament disappeared.	118	S05	5/27	Filament partially disappeared; re-formed by 29 May.
285	S05	5/13	Filament disappeared.	115	N22	6/1	Filament disappeared again.
261	S07	5/14	Filament disappeared near east limb.	105	N49	5/31	Filament disappeared in apparent response to birth of nearby active region; re-formed 1 June.
256	N18	5/13	Maximum development of great class E spot group.	100	N14	5/26	Large filament disappeared.
241	S09	5/17	Birth of small active region that reached maximum next day as large class B spot group.			5/30	Filament disappeared; partially re-formed next day.
		5/21	New spot growth slightly south of original spots. Reached maximum next day as small class D spot group.				Filament disappeared again, in apparent response to rearrangement of neutral line to include nearby active region.
218	S25	5/23	Large filament disappeared.	88	S12	5/26	Filaments on both north and south border of large-scale cell disappeared near east limb. Both had re-formed by 29 May.
216	N04	5/20	Birth of small active region.			5/30	Northern filament disappeared again; re-formed by 2 June.
210	S01	5/17	Filament disappeared near east limb, in apparent response to birth of nearby active region.		N09	5/29	Birth of small active region on southern boundary of faint plage.
	S09	5/17	Birth of small active region near east limb.			5/31	Birth of additional region slightly west of the region mentioned above. Grew to maximum on 2 June as class D spot group.
	N19	5/24	New growth to class C spot group by next day. Large filament disappeared near west limb, in apparent response to growth of nearby active region.	64	S20	5/29	Birth of small active region on northern border of single sunspot that had returned from previous solar rotation.
202	N17	5/24	Birth of small active region with group axis steeply inclined to solar equator. Formed near twin leader spots of moderate active region that had been slowly declining throughout its disk passage.	62	N10	6/2	OMP of equator-crossing filament channel with active filaments intermittent along its entire length.
190	S30	5/25	Active filament disappeared in apparent response to growth in nearby active region.	54	N18	5/29	Maximum development of small class D spot group near active filament.
184	N24	5/22	Filament disappeared.	30	N21	6/4	Large filament disappeared.
168	N20	5/29	Birth of small active region near west limb.	22	N06	6/1	Filament disappeared near east limb.
165	N16	5/19	Probable date of birth of active region at east limb. Grew to first maximum on 22 May as small class C group.				
		5/24	Minor new growth in following portion of plage. Accompanied by formation of active filament on southern border of the region.				

Note: There were no days without H-alpha photographs.

# H $\alpha$ SYNOPTIC CHART

1970 - ROTATION 1561

Last Revision 9/21/77 SLO

H $\alpha$  SYNOPTIC CHART  
1970 - Rotation 1562

*Long.	*Lat.	Date	Descriptive Notes	*Long.	*Lat.	Date	Descriptive Notes
359	N35	6/5	Filament became especially large after this date.	240	N16	6/14	Maximum development of class D spot group with high spot count. Formed between two very large and active regions.
356	S45	6/10	Filament disappeared near west limb.	235	N10	6/15	Large filament formed between closely-spaced active regions.
351	S14	6/7	Birth of small active region with very slow development to maximum on 11 June as small class B spot group.	218	N19	6/15	Maximum development of great class F spot group that evolved from three separate groups merged end to end.
338	N15 N14	6/10 6/13	Filament disappeared. Birth of small active region in filament channel at west limb.	211	S20	6/16-17	Filament disappeared.
316	N16	6/6	Filament disappeared; re-formed by 9 June.	210	N20	6/13	Birth of active region at trailing end of great class F group. Grew to maximum by 15 June and merged with the larger region. Great flare occurred 14 June at point of merger.
312	N17	6/5	Birth of small active region near east limb. Rapidly faded after 10 June.	200	S15	6/23	Filament disappeared near west limb after steady growth for previous 5 days.
	N25	6/10	Filament became active same day as disappearance of filament on same neutral line at (338,N15).	198	N16	6/22	Filament disappeared.
311	N11	6/7	Birth of small active region that merged with small region north of this location.	192	S07	6/16-17	Filament disappeared.
		6/11	Minor growth.	190	N26	6/19	Filament disappeared; re-formed next day.
		6/13	Stronger growth with maximum on 14 June as small class D group.			6/22	Filament disappeared again.
295-315	S10-20	6/10-11	OMP of complex of two old active regions that had formed on the same longitude and 7° apart in latitude during the previous solar rotation. By rotation 1562, the regions had separated 15° in longitude, indicating an unusual amount of shear. An east-west filament formed between them and equatorward of the large leader spot of the more southerly region.	183	N21	6/16-17	Filament disappeared.
297	S12	6/9	Birth of small active region in following portion of large faint plage. Disappeared by 12 June.	157	S13	6/21	Birth of active region centered on small faint plage. Grew to maximum next day as class C spot group.
290	N17	6/8	Birth within faint plage of active region with small spots. New spots grew to maximum by 10 June as complex D group. Dissipated rapidly.			6/25	Minor growth on northern edge of leader spot.
286	N36 S06	6/14 6/15	Filament present this day only. Birth of small active region at end of small, curved filament and in position of older faint plage.	142	N04	6/25	Northern portion of equator-crossing filament disappeared. Re-formed next day.
262	N19	6/10	Birth of small active region between two large leader spots of old regions on a common neutral line, giving the appearance of a class F spot group.	131	N23	6/24	Filament disappeared within area of faint plage.
		6/13	Birth of fourth active region within this complex, as spots formed on northern border of the large western leader spot. When the new spots had grown to maximum on 14 June, the new leader and original large leader spots had merged.	110	N10	6/29	Large filament disappeared near west limb.
				100	N29	6/22	Filament disappeared in apparent response to growth of nearby active region. Re-formed by 24 June.
						6/26	Filament disappeared again; re-formed next day.
				96	N11	6/22	Maximum development of complex class D spot group. Appeared to consist of a young spot group that emerged near the old leader spot which had returned from the previous disk passage.
					S05	6/30	Semicircular filament disappeared.
				95	N22	6/22	Maximum development of follower-dominant C spot group.

Note: There were no days without H-alpha photographs.

1970 - ROTATION 1562

Last Revision 9/21/77 SLO

H $\alpha$  SYNOPSIS CHART  
1970 - Rotation 1562 (Continued)

°Long.	°Lat.	Date	Descriptive Notes
75	N05	6/26 6/29	Birth of small active region within small faint plage. New growth began with maximum on 2 July as small class D spot group. Axis inclination slightly negative, i.e., leader spot at higher latitude than follower. Portion of large filament disappeared.
	N34	6/29	
58	N15	7/1	Birth of small active region near large filament.
56	S10	6/28 6/30	Birth of small active region near class D spot group. More rapid growth to maximum as small class D spot group.
50	N36	7/2	Large filament disappeared; partially re-formed next day.
48	S08	6/28	Maximum development of simple, small class D spot group.
46	N05	6/27	Birth of small active region.
40	N22	6/24	Probable date of birth at east limb of active region that grew to maximum by 29 June as class F spot group.
20	S18	7/4	Filament disappeared.
15	S03	6/26	Probable date of birth at east limb of active region that grew during almost all of its disk passage. Maximum occurred on 4 July as class D spot group with high spot count.
12	N10	7/5	Birth of small active region.
5	N10	7/1	Filament disappeared in response to growth of nearby active region.
1	N07	6/28 7/2	Probable date of birth near east limb of active region that grew to maximum by 2 July as class D spot group. Birth of new region on northern border of leader spot.

Note: There were no days without H-alpha photographs.

# H $\alpha$ SYNOPTIC CHART 1970 - Rotation 1563

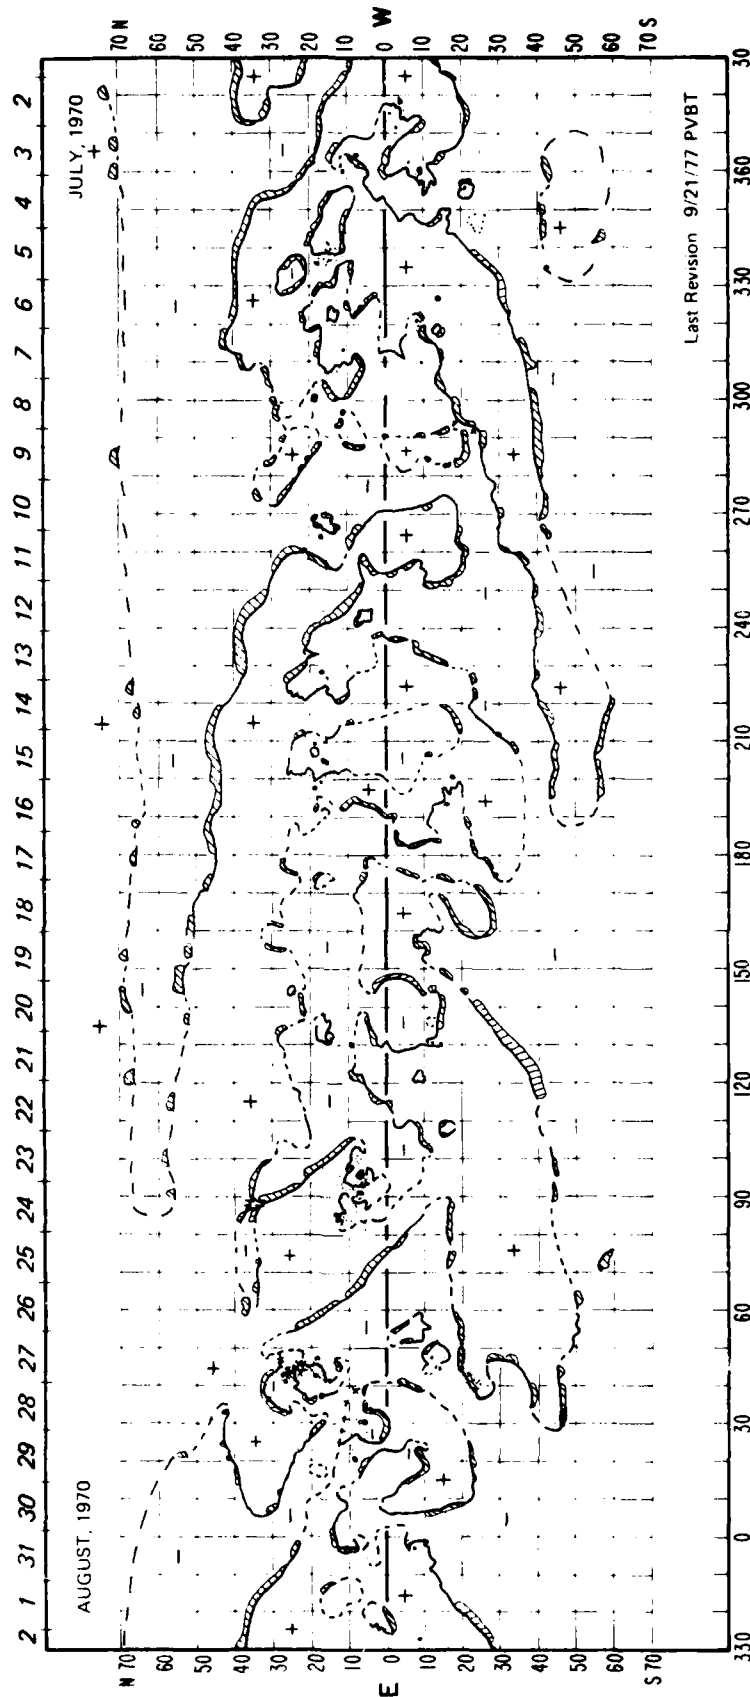

Long.	Lat.	Date	Descriptive Notes	Long.	Lat.	Date	Descriptive Notes
359	S08	6/28	Birth of active region on northern border of large single leader spot near east limb. Growth of new region led to merger with large spot, creating great circular penumbral area containing spots of both polarity ("delta" configuration). Maximum spot area on 2-3 July.	175	N15	7/13	Birth of small active region.
355	S21	7/4	Birth of small active region.	166	S27	7/21	Filament disappeared.
347	S24	7/5	Birth of small active region.	147	S03	7/16	Filament disappeared near east limb; re-formed by 18 July.
345	N36	7/7	Large filament disappeared.	138	N17	7/19	Birth of small active region in center of old, faint plage.
338	N15	6/30	Birth of active region near east limb that grew to maximum by 4 July as small class D spot group.	133	N28	7/18	Small filament disappeared; re-formed 21 July; gone next day.
337	N24	7/5	Filament disappeared; re-formed next day.	122	S10	7/19	Birth of small active region.
325	N05	7/7	Filament disappeared again.	110	S17	7/18	Birth of small active region.
320	S10	7/4	Small filament disappeared; replaced by small plage this day only.	106	S09	7/25	Filament disappeared.
		7/7		93	N08	7/17	East limb passage of great complex sunspot group.
		7/8				7/21	Maximum development of class E spot group with strong "delta" configuration in leader spots, compact form and high spot count.
320	S10	7/4	First maximum in development of class F spot group.				Filament disappeared near west limb.
		7/5	Formation of small bipolar group of spots on northern border of follower spot.	90	N29	7/29	Filament disappeared.
		7/6	Growth of spots on northern border of leader spot.	85	S17	7/23	Filament disappeared.
		7/8	New spots formed in center of region.	83	N10	7/22	Birth of small active region on following border to great active center.
		7/10	Another area of new spots formed north of follower spot.			7/25	New growth brought area to maximum next day as peculiar class C spot group.
310	N11	7/3	Maximum development of small class C spot group.	61	N37	7/24	Filament disappeared as nearby neutral lines rearranged; re-formed 29 July.
305	N07	7/13	Filament disappeared near west limb.			7/31	Filament disappeared again near west limb.
288	N08	7/8	Filament disappeared simultaneously with filament disappearance north of this location.	58	N18	7/23	One half of large filament, located midway between great active centers, disappeared. Re-formed by 29 July.
281	N21	7/8	Filament disappeared.	50	S11	7/30	Small filament disappeared that encircled leader spot.
278	N21	7/12	Birth of small active region.	45	S13	7/24	Maximum of simple class D spot group.
266	N17	7/6	Birth of small active region on western border of large, single sunspot that had returned for third disk passage.				New growth within old plage of moderate intensity led to complex class D spot group next day. The D group formed complex with remnants of region north of it that had been a great class F spot group during previous rotation.
				38	N32	7/23	Filament disappeared near east limb; re-formed by 26 July.
260	S20	7/16	Filament disappeared near west limb.			7/30	Filament disappeared again.
255	S01	7/8	Filament partially disappeared.	37	S46	7/26	Large filament disappeared near east limb.
		7/11	Remainder of filament disappeared.	30	Equator	7/30	Active filament formed southwest of leader sunspot.
243	N05	7/16	Birth of small active region.			8/1	Filament disappeared with large flare in active region.
240	N37	7/13	Filament disappeared.	29	N18	7/28	Birth of small active region.
202	N18	7/12	Maximum development of class D spot group.	25	N06	7/25	Birth of active region near east limb that grew rapidly to maximum by 28 July as class E spot group.
		7/16	Birth of small active region at position of declining leader spot. Maximized 18 July.	19	S10	8/2	Filament disappeared.
		7/18	New growth in center of region continued until west limb passage on 21 July.				
196	S18	7/12	Maximum development of open class D spot group with axis at negative inclination to solar equator, i.e., leader spot at higher latitude than follower.				
193	N09	7/12	Filament disappeared near east limb.				
183	S09	7/18	Filament disappeared from within faint plage.				

Note: There were no days without H-alpha photographs.

# H<sub>α</sub> SYNOPTIC CHART

1970 - ROTATION 1563

Last Revision 9/21/77 PVBT

H $\alpha$  SYNOPTIC CHART  
1970 - Rotation 1564

°Long.	°Lat.	Date	Descriptive Notes	°Long.	°Lat.	Date	Descriptive Notes
358	S08	7/29	Maximum development of complex plage and small spots on northern border of large leader spot returned from previous disk passage.	203	N20	8/12	Birth of two regions near center of and near leader of this large group and formation of active filament embedded in the original plage.
340	Equator	8/2	Gradual disappearance of small filament in apparent response to growth of nearby region.			8/13	Neutral line became highly convoluted as it rearranged to include new areas into the principal neutral line.
336	N03	7/31	Birth of small active region.	200	S60	8/9	Large filament disappeared.
330	N38	8/6	Large, long filament disappeared near west limb.	185	S23	8/16	Filament disappeared in apparent response to growth of nearby active region.
296	S15	8/1	Part of large, curved filament disappeared.	179	S09	8/12	Birth of active region that remained very small until 15 August.
295	N14	7/30	Probable date of birth at east limb of small active region that grew slowly to maximum on 4 August as class C spot group. Spots and plage underwent significant variations on each day of disk transit.			8/14	Beginning of rapid growth, reaching maximum on 17 August as simple class E spot group.
290	N39 S40	8/2 8/2	Part of large, long filament disappeared. Large filament disappeared near east limb.	176	S12	8/16	Filament between active regions disappeared.
275	N02	8/2	Filament disappeared near east limb; re-formed 8 August.	173	S12	8/15	Birth of small active region near follower of class E spot group.
	N23	8/9 8/4	Filament disappeared again. Filament disappeared within faint plage; re-formed by 8 August.	163	S14	8/18	Birth of small active region near leader of large spot group.
260	S22	8/3	Filament disappeared near east limb. Began re-forming next day and continued active throughout disk passage.	158	N10	8/17-20	Filament active last 4 days of disk passage.
	S11	8/7	Birth of small active region in filament channel.	152	S16	8/14	Birth of active region that grew to maximum by 17 August as follower-dominant class D spot group. Formation and growth were in unison with development of nearly identical region 30° to the west.
257	N25	8/5 8/12	Filament disappeared; re-formed 8 August. Filament gradually disappeared.	145	S15 & S25	8/15	Two filaments disappeared simultaneously in response to birth of nearby active region and to alteration of their underlying neutral lines, which incorporated the new active region into the large-scale magnetic pattern.
250	S06	8/6	Birth of active region that grew to maximum by 8 August as class D spot group.				Partial filament disappearance.
248	N07	8/10	Active filament disappeared.	136	S05	8/20	Large filament disappeared.
238	N18	8/3	Birth at east limb of great active region that grew to first maximum on 8 August as follower-dominant class E spot group.	130	S28 N21	8/17 8/17 8/23	Birth of small active region. Second and stronger region born at this location at west limb.
		8/9	Birth of new region in center of large spot group.				Active filament disappeared.
		8/14	Grew throughout remainder of disk passage. Maximum observed development as compact, complex class F spot group at west limb.	102	N20	8/22	East limb passage of great active region which was at peak on previous disk passage. Characterized this rotation by large and complex follower spot with "delta" magnetic configuration. Leader spots were very small and short-lived.
208	S03	8/15	Equatorial portion of long filament disappeared.	94	N10	8/13	
203	N20	8/7	Birth of important active region near east limb in center of faint plage. Grew to first maximum on 10 August as follower-dominant class D spot group with large symmetric leader and follower spots and with group axis strongly inclined to solar equator.				

Note: There were no days without H-alpha photographs.

1970 - ROTATION 1564

H $\alpha$  SYNOPTIC CHART  
1970 - Rotation 1564 (Continued)

*Long.	*Lat.	Date	Descriptive Notes
81	S05	8/19	Birth of active region in a filament channel and at southern end of large, active filament. Born same day as another important region near northern end of same filament. Grew to maximum by 23 August as class D spot group.
75	N21	8/19	Birth of active region at northern end of large filament and near a large convolution in the filament channel extending from the filament. Growth of this region led to significant restructuring of the filament channel so that the large-scale neutral line incorporated the new active region. Reached maximum on 21 August as follower-dominant class D spot group.
65	N18	8/22	Large active filament disappeared in apparent response to growth of two active regions at opposite ends of the filament. Re-formed 24 August.
62	S40	8/25	Birth of small active region.
53	N13	8/21	Peak development of small class C spot group.
41	N19	8/20	Birth of active region that reached maximum on 23 August as class C group with high spot count.
35	N13	8/23	Birth of small active region within extensive complex of faint regions.
29	N05	8/25	OMP of single, symmetric sunspot surrounded by vortical fibril pattern with counterclockwise twist.
28	N17	8/20	Birth of small active region on eastern edge of minor activity complex.
22	S17	8/28	Birth of small active region within filament channel.
21	N12	8/23 8/26	Filament disappeared; re-formed 25 August. Filament disappeared again.
10	N08	8/29	Birth of small active region.
5	N25	8/23	Filament disappeared near east limb in apparent response to merger of large-scale areas of positive polarity.

Note: There were no days without H-alpha photographs.

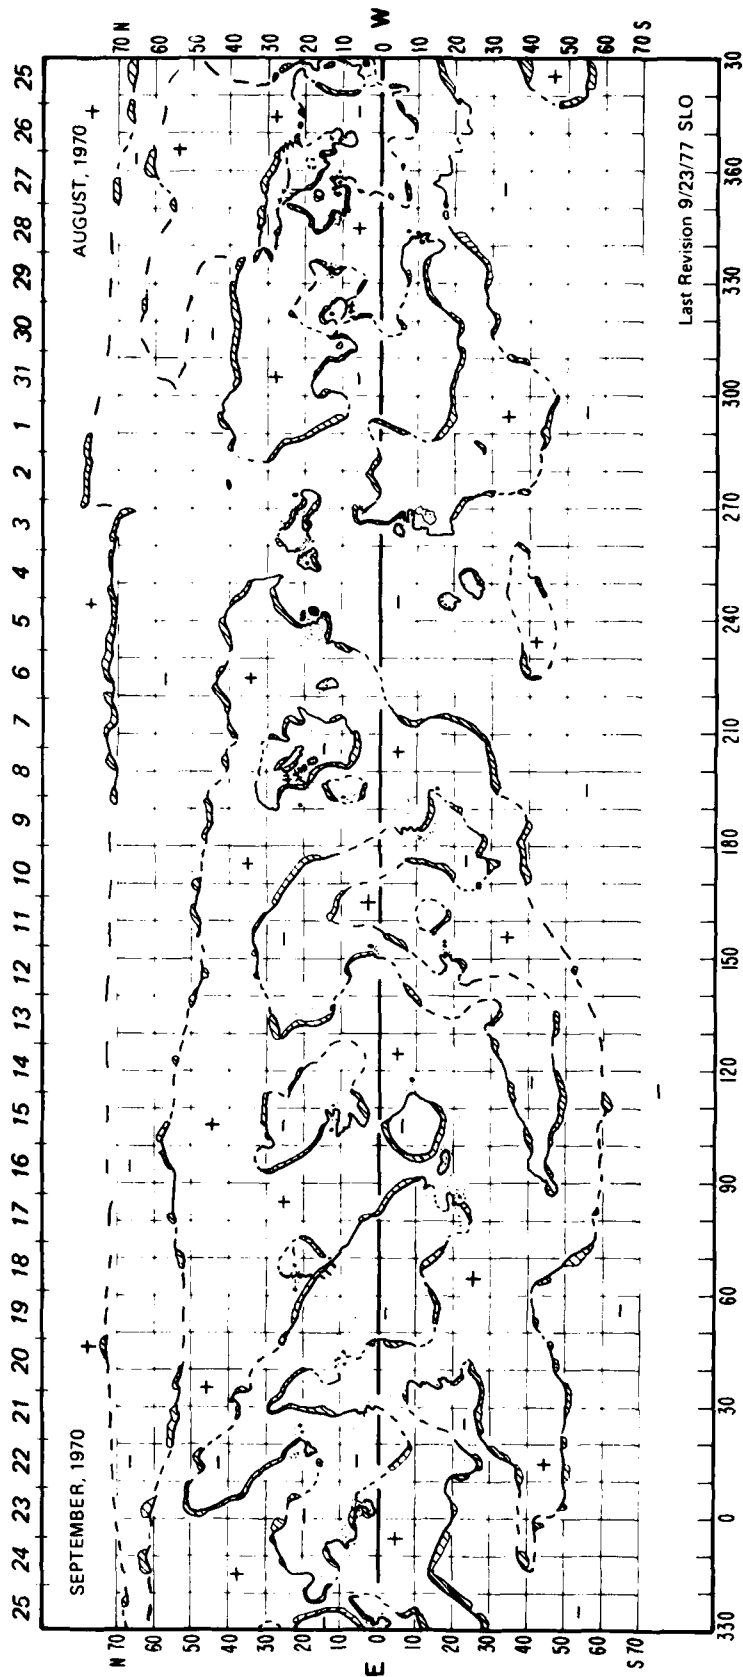

# H $\alpha$ SYNOPTIC CHART 1970 - Rotation 1565

°Long.	°Lat.	Date	Descriptive Notes	°Long.	°Lat.	Date	Descriptive Notes
358	N11	8/26	Birth of small active region on southern border of large leader sunspot.	270	N21	9/5	Filament disappeared that was embedded in center of region.
355	N15	8/31	Birth of small region on northern border of old leader sunspot.	N04 S21	8/30 9/5		Birth of small active region. Filament disappeared.
352	N20	8/23	Curved filament north of active region disappeared; re-formed next day.	268	S13	9/4	Birth of small active region.
		8/28	Filament disappeared again; re-formed 30 August in two parts over new configuration of underlying neutral line. New pattern resulted from merger of active region pattern with large-scale area that had moved eastward.	265	S05	8/31	Birth of small active region within trailing portion of plage coincided with rapid decay of older spots.
349	N11	9/2	Birth of small active region near west limb.			9/6	Birth of third active region in this location, which grew to small class D by next day, just before west limb passage.
346	N10	8/28	Birth of small active region in trailing edge of large region.	258	N21	8/31	Birth of small active region that dissipated rapidly with birth next day of stronger region just south of this location.
342	S07	8/23	Birth of active region near east limb that joined with new region on its southern border next day to form single region. Became class C spot group by 25 August.	N19	9/1		Birth of active region that grew to class D by 4 September and merged with large region to its west. Growth continued intermittently until west limb passage.
		8/24	Birth of active region on southern border of, and perfectly aligned with, region of identical size and 3° to the north. The regions formed a single plage with double spot groups. Newer spots reached maximum by 26 August as class C group.	250	S25	9/5	Birth of small active region.
338	S26	8/26	Almost all of large filament disappeared near east limb.	244	S18	9/5	Birth of small active region.
333	N12	8/31	Birth of small active region on western border of existing active region.	238	N18	9/5	OMP of great active region on second disk transit with class E spot group. Very large and complex leader spot exhibited counterclockwise rotation.
325	N13 N38	8/27 8/28	Maximum development of follower-dominant class C group. Part of large filament disappeared.			9/8	Large active filament disappeared from northern edge of region.
315	N11	8/31	Birth of small active region near trailing edge of existing active region and at position of faint plage that had nearly disappeared by this date. This birth created complex chain of three small active regions at the same latitude.	225	N40	9/2	Filament disappeared near east limb.
		9/2	Birth of fourth small active region at eastern end of chain of three small regions.	214	S18	9/8	Large filament disappeared.
295	S18	9/5	Filament disappeared near west limb.	202	N40	9/4	Filament disappeared at east limb.
287	N22	8/29	Filament disappeared; re-formed at lower latitude by 3 September.	195	N05 N21	9/2 9/4-6	Filament disappeared near east limb. Active filament suspended far above neutral line in large, old region with decaying class E spot group.
280	N01	9/2	Filament disappeared.	192	N10	9/8-11	Fibrils surrounding isolated leader spot formed counterclockwise vortical pattern these 4 days only.
270	N21	8/29	Maximum development of class E spot group with large leader spot but small followers.	190	S08	9/5	Small active region formed north of region that just passed maximum development and contained very small spots.
				188	S13	9/8	Filament disappeared from moderately bright plage with single small sunspot.
						9/11	Formation of two new spot groups in western and southern portions of this region. Neither exceeded class B by next day. Plage bright and complex at west limb passage.

Note: There were no days without H-alpha photographs.

°Long.	°Lat.	Date	Descriptive Notes
187	M45	9/7	Filament disappeared.
165	M10	9/9	Filament disappeared.
150	M03	9/8	Birth of active region that reached maximum next day as class C spot group.
132	M18	9/13	Filament disappeared from faint plage.
115	S35	9/18	Filament disappeared near west limb.
109	M11	9/13	Birth of active region within extensive faint plage. Grew to maximum by 15 September as small class D spot group.
		9/18	New growth began that produced complex, but small, class D spot group by next day.
105	M25	9/16	Filaments on northern and eastern borders of this large-scale feature disappeared same day.
97	S18	9/18	Birth of active region that grew to class C at west limb on 21 September.
84	S21	9/13	Birth of active region that grew to maximum by 15 September as class C spot group.
70	S15	9/20	Filament disappeared.
66	M22	9/20	Birth of active region that grew rapidly to class D spot group in brilliant plage by next day.
60	M20	9/20	Filament disappeared with birth of nearby active region.
58	S15	9/19	Filament disappeared.
47	S05	9/16	Filament disappeared.
43	M09	9/21	Birth of active region that grew to maximum by 23 September as class D spot group.
30	M04 M20	9/19 9/23	Birth of small active region. Filament disappeared in apparent response to growth of nearby active region.
20	M20	9/16	Birth at east limb of active region that grew to compact class E spot group on 21 September. Proper motions of leader spots led to their coalescence into large single spot by 24 September.
15	M47	9/23	Filament disappeared; re-formed 26 September as part of large semicircular filament on border of large-scale, negative-polarity area.
2	M03	9/19	Birth of small active region.
1	M07	9/24	Filament disappeared from complex, faint plage.

Note: There were no days without H-alpha photographs.

H $\alpha$  SYNOPTIC CHART  
1970 - Rotation 1566

°Long.	°Lat.	Date	Descriptive Notes	°Long.	°Lat.	Date	Descriptive Notes
326	N11	9/24	Maximum development of class D spot group on southern border of large, faint plage.	122	N17	10/4	Probable date of birth at east limb of active region that became class D spot group by 6 October with large leader spot but with few and very small followers.
322	N23	9/24	Birth of active region on northern border of large, faint plage. Grew to maximum by 26 September as class E spot group with structure resembling two overlapped bipolar areas.			10/9	Birth of second active region in northern portion of plage. New spots grew to maximum by 11 October.
	S20	9/24	Birth of small active region.			10/9	Birth of third small region near the following edge of plage. These spots also grew to maximum by 11 October, so that the combination of these three overlapped sunspot groups formed a class E spot group with small spots.
321	N11	9/30	Birth of small active region in trailing portion of large, old plage.			10/6	Birth of small active region at east limb that persisted for the entire disk passage. Maximum development occurred on 11 October with follower-dominant class C spot group.
320	N07	9/25	Filament disappeared on southern border of active complex.	S11			Birth of small active region between small, young region and faint plage of older region. Disappeared by 12 October.
288	S12	9/29	Small active region formed south of large leader sunspot.			10/15	Curved filament, associated with active region, disappeared.
287	N17	10/3	Large active filament disappeared near west limb.	117	S12	10/7-8	Half of large filament disappeared; re-formed after 14 October.
	N08	9/28	Birth of small active region on western edge of small, faint plage.			10/13	Birth of small active region.
285	N17	9/25	Birth of small active region.	113	N18	10/15	Long filament disappeared.
	N05	10/2	Birth of active region near sites of two small regions that recently had disappeared. Grew slowly during last 3 days of disk passage, but did not exceed class A spot group.	106	N15	10/11	Birth of active region within complex, faint plage. Grew to maximum by 15 October as class D spot group. By this date it formed leading portion of activity complex that included another young region.
265	S27	9/30	Large filament disappeared.	90	S10	10/13	Filament disappeared near east limb in apparent response to growth of nearby active region.
254	S08	10/6	Birth of small active region.	70	N67	10/17	Birth of new active region centered on plage from earlier region. Grew to maximum by 17 October as class D spot group. Merged with extensive faint plage and with strong region centered at (60,N05).
245	N18	10/3	Birth of active region in center of extensive, faint plage that was remnant of great active center of previous 2 solar rotations. Grew to maximum by 5 October as class C spot group with primitive penumbra.	60	N05	10/12	Birth of small active region near east limb.
218	S23	10/5	Large filament elevated and became tenuous for remainder of disk passage.	53	S10	10/13	Birth of small active region.
194	N14	10/7-8	Filament disappeared.	47	N11	10/14	Filament disappeared.
191	N16	10/4	Filament disappearance in faint plage followed by parallel-ribbon flare.			10/12	Birth of active region. Reached maximum on 18 October as class D spot group. Bordering structures were in contact with active regions north and west of this location.
190	S22	10/9	Large filament disappeared, associated with old plage that was merging with large, younger active region.	45	S13	10/12	Birth of small active region.
183	S11	10/1	Probable date of birth near east limb of active region in trailing portion of large, faint plage. New region grew to maximum by 5 October as complex class D spot group.	37	S19	10/20	Filament disappeared.
		10/7-8	New growth in center of region led to second and larger maximum on 9 October as complex class E group.	36	S30	10/15	Birth of active region. Beginning of rapid growth.
175	S29	10/3	Birth of small active region.	35	N10	10/14	Birth of active region.
		10/11	Filament disappeared that had formed after plage disappeared.			10/17	Beginning of rapid growth. Bordering structures were in contact with active regions north and west of this location.
167	N32	10/8	Birth of small active region.				
143	N09	10/6	Filament disappeared.				

Note: Day without H-alpha photographs was 7 October 1970.

1970 - ROTATION 1566

# H $\alpha$ SYNOPTIC CHART 1970 - Rotation 1567

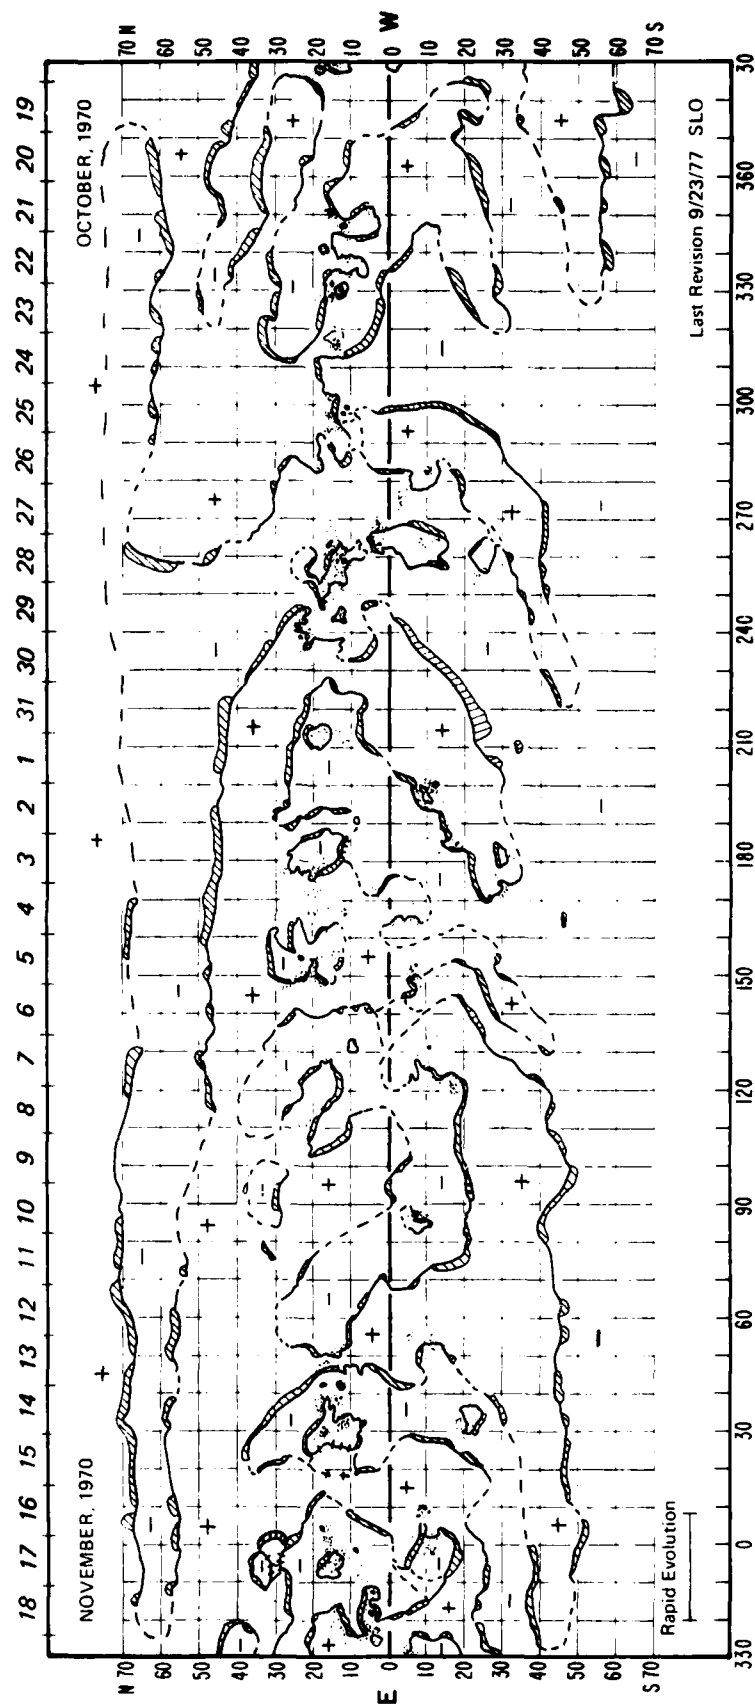

°Long.	°Lat.	Date	Descriptive Notes	°Long.	°Lat.	Date	Descriptive Notes
352	N15	10/25	Birth of small active region near former position of leader spot of old active region. Growth continued until west limb passage on 27 October, but region had not exceeded class B spot group.	235	N05	10/29	Filament disappeared.
344	N11	10/23	Birth of new region in center of old region with large leader sunspot. Growth of new spots coincided with rapid decay of leader spot until it nearly vanished within 24 hours. New spots did not exceed class B spot group.	230	S15	10/30	CMP of exceptionally large filament.
342	N36	10/19	Part of filament disappeared.	215	N43	11/04	Large filament disappeared.
330	S18 N02	10/24 10/27	Filament disappeared; re-formed next day. Large filament disappeared near west limb, in apparent response to growth of nearby active region.	193	S12	10/26	Major eruption at east limb in progress at 1435 UT from large, old active region just beyond the limb. Formation of small new region on northeast border of leader sunspot.
325	N17	10/24	Filament disappeared within faint plage. Re-formed next day, while large filament along same neutral line northeast of this location disappeared.	190	N45	11/5	Western end of long filament disappeared.
316	N14	10/25	Birth of active region that grew to small class C spot group before west limb passage on 30 October.	183	N19	11/4 11/7	Filament disappeared; re-formed 6 November. Filament disappeared again.
315	N32	10/25	Large filament disappeared.	180	S30	11/3	Birth of small active region.
283	Equator N19	10/24 10/27	Filament disappeared. Birth of small active region.	175	Equator	11/2	Filament disappeared.
281	N29	10/27	Filament disappeared in apparent response to birth of nearby active region.	172	N02	11/5	Birth of small active region.
266	N03	10/28	Birth of active region with exceptionally fast growth to maximum next day as moderate-size class D spot group.	167	N11	11/7	Birth of small active region.
262	N15	10/25	Maximum development of large class D spot group that formed leading member of major activity complex. Growth represented rejuvenation of activity complex of 2 rotations earlier. Group axis was inclined to solar equator at strong negative angle, i.e., leader spot was at higher latitude than follower.	155	N31	11/5	Filament disappeared.
260	N60	10/26	Birth of new region on southern border of leader spot. Maximum development occurred on 29 October.	153	N19	11/2	Birth of small active region in center of southern section of large plage associated with single leader sunspot.
245	N14	10/24	Large filament disappeared.	152	N17	11/8	Birth of another active region in southern border of this activity complex. Grew to small class D spot group by west limb on 11 November.
242	N19	10/25	Maximum development near east limb of great class E spot group with axis steeply inclined to solar equator. Formed trailing member of major activity complex on large-scale neutral line that was apparent source of a sector boundary in interplanetary magnetic fields.	150	S07	11/4	Birth of active region with first maximum on 6 November as class C spot group with primitive penumbra.
				145	S25	11/4	Filament disappeared.
				140	S22	11/5	Filament disappeared in apparent response to birth of active region north of this location.
				132	N09	11/6	Birth of small active region.
				127	N16	11/6	Birth of small active region within center of faint plage and on existing large-scale neutral line.
				123	S13	11/5	Large plage that formed from merger of two active regions before east limb passage was source of major proton flare on this day. The two spot groups, aligned nearly north-south from one another, were small at this time. Plage continued large, compact and bright for almost all of disk passage, but with very small spots.

Note: There were no days without H-alpha photographs.

# H $\alpha$ SYNOPTIC CHART

1970 - ROTATION 1567

H $\alpha$  SYNOPTIC CHART  
1970 - Rotation 1567 (Continued)

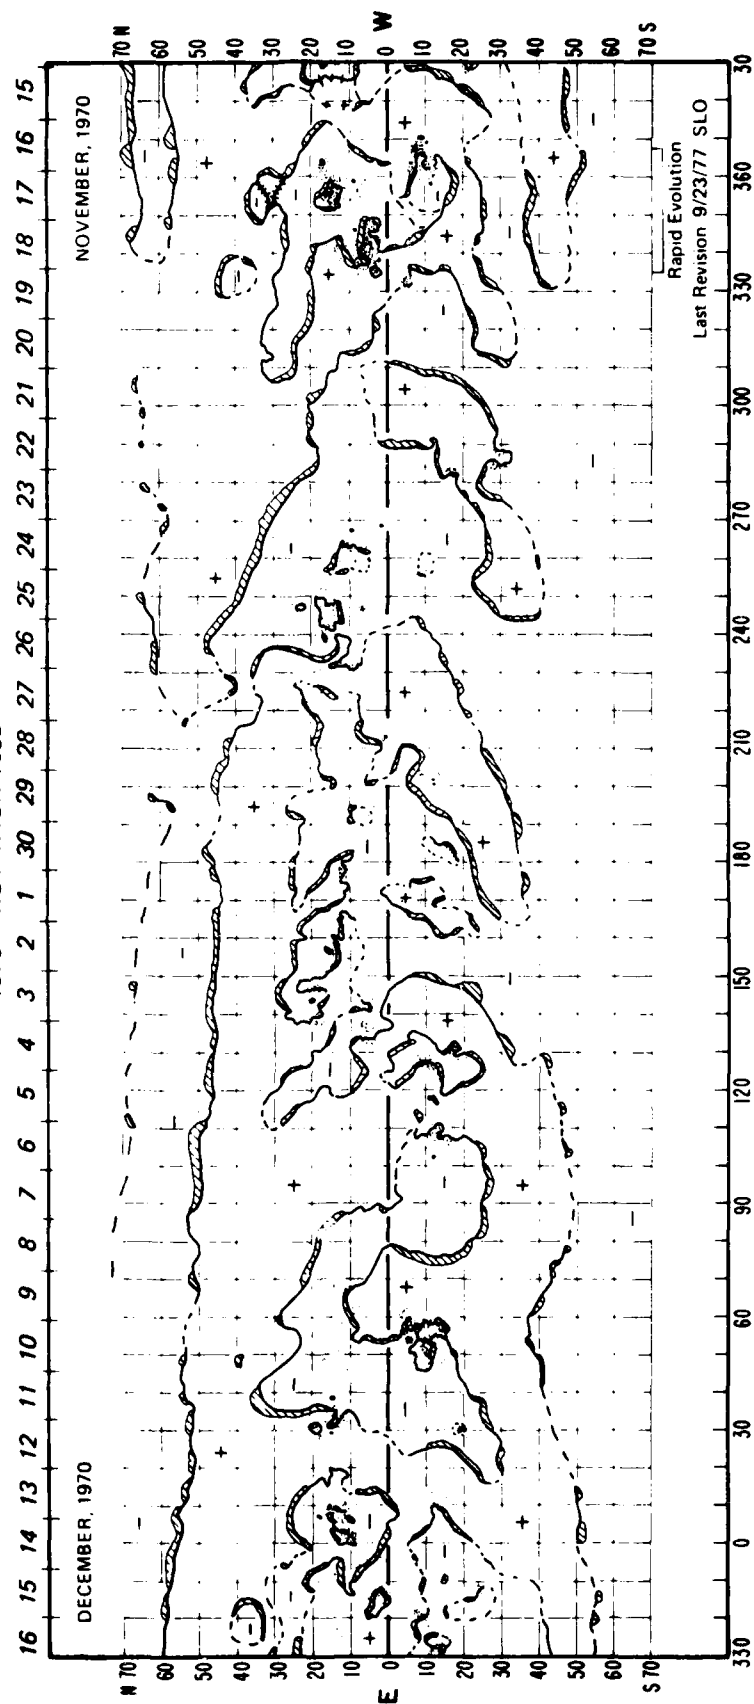

*Long.	*Lat.	Date	Descriptive Notes
123	S13	11/12	Dark filament formed within northern proton of this region near west limb. An additional large active region arose at this location before the next rotation.
100	S20	11/8	Large filament disappeared in apparent response to growth of active region northeast of this location.
86	S08	11/7	Birth of small active region.
55	S06	11/16	Birth of small active region.
53	S12	11/9	Birth of small active region.
45	Equator	11/11	Filament disappeared in apparent response to growth of nearby active region.
38	N26	11/13	Filament disappeared in apparent response to growth of nearby active region; re-formed next day.
		11/15	Filament disappeared again.
35	N16	11/11 11/12	First maximum of large class E spot group. Birth of major new region within northern half of existing region. Grew to maximum by 17 November as one of largest and most complex class F spot groups of this solar cycle.
32	S21	11/13	Birth of small active region.
3	S10	11/16	Maximum development of small class E spot group.
0	N16	11/14 11/17	Birth of active region at northwest border of large activity complex. Slow initial growth. Region began rapid growth. Maximum next day as class D spot group.

H $\alpha$  SYNOPTIC CHART  
1970 - Rotation 1568

*Long.	*Lat.	Date	Descriptive Notes	*Long.	*Lat.	Date	Descriptive Notes
358	S17	11/17	Active filament south of active region disappeared after having formed previous day. Re-formed 20 November.	179	N16	12/5	Filament disappeared near west limb.
		11/21	Filament disappeared again near west limb.	178	N09	12/6	Birth of small active region near west limb.
343	N05	11/18	Simultaneous birth of strong new regions on both the northern and southern edges of a large, complex region that already contained two complicated spot groups. Maximum development next day as class F group(s) with many spots.	159	N14	11/29	Maximum development of small active region on southern border of large leader spot that had returned from previous disk passage.
		11/21	Birth of small fifth region at N15 on border of the complex.	152	N15	11/30	Birth of small active region near center of old plage associated with large leader sunspot.
331	S05	11/17	Birth of small active region that disappeared next day.	147	S15	12/5	Large, active filament disappeared; re-formed 7 December.
312	N09	11/22	Birth of small active region.	143	N06	12/2	Birth of small active region.
	N23	11/23	Half of filament disappeared.	140	M46	12/7	Almost all of small filament sections along polar-crown neutral line disappeared this day. Judging from its elevated form, the author suspects that the remaining large section may have disappeared next day.
310	Equator	11/17	Portion of large filament disappeared near east limb.				
308	S15	11/20	Remaining portion of large filament disappeared.	133	M05	11/29	Birth of small active region near east limb. Grew to maximum by 2-3 December with class B spot group.
282	S18	11/22	Birth of small active region.	129	S17	11/30	Birth of active region near east limb among complex faint plage and filaments. Grew slowly first 3 days.
280	S24	11/24-25	Filament disappeared.			12/4	More rapid growth, reaching maximum next day as small class D spot group.
269	N02	11/24	CHP of single sunspot without accompanying plage.	116	S09	12/3	Formation of small area of complex plage and absorption material on northern border of leader spot of large, old class F spot group. Similar formation near following lower spot as well, but only leader area persisted for next few days.
260	S25	11/25-26	Filament disappeared.	58	S11	12/7	Maximum of small class C spot group.
	N35	11/27-28	Great filament disappeared.	56	S05	12/9	Birth of active region near northern edge of complex of two small regions. New region grew to maximum by 14 December as large class D spot group near west limb.
	N14	11/28	Filament disappeared same day as large filament disappearance north of this location.	55	S11	12/6	Birth of active region near following end of small region. New group grew to class D by next day and declined thereafter. The two regions blended after 8 December.
255	S09	11/27	Birth of small active region at site of faint plage that had disappeared during previous few days.	35	M20	12/12	Large filament associated with large, old active region that was especially active throughout the disk passage.
248	N14	11/23-24	Birth of active region just west of large leader sunspot that remained from great activity complex of previous rotation. New region grew to maximum by 28 November with small class C spot group.	30	S20	12/14	Birth of small active region.
247	N08	11/29	Birth of small active region.	12	S12	12/16	Small active region emerged almost centered on small faint plage.
243	S16	11/28	Birth of small active region			12/19	Associated filament disappeared at west limb.
234	N61	11/23	Filament disappeared.	5	N13	12/12	Maximum development of complex of two class D spot groups with numerous small spots and rapid variations from day-to-day. Complex quickly dissipated during remainder of disk passage. Neither region was associated with a large-scale neutral line.
233	N16	12/1	Filament disappeared within faint plage near large single sunspot that lay close to west limb.				
213	N05	11/29	Filament disappeared.				
197	S09	11/28	Active filament within faint plage near sunspot partially disappeared; re-formed next day.				
		12/1	Partially disappeared again; re-formed next day.				
		12/3	Disappeared again near west limb.				

Note: Days without H-alpha photographs were 24 and 26 November and 8-10 December 1970.

1970-1971 - Rotation 1569

$^{\circ}$ Long.	$^{\circ}$ Lat.	Date	Descriptive Notes
350	N20	12/12	Filament disappeared; re-formed next day.
310	S18	12/21	Filament disappeared.
306	S11	12/18	Birth of small active region.
294	N25	12/18	Birth of large, reversed-polarity active region that reached maximum 21 December as class D spot group. Formed large activity complex with two large decaying regions southeast of this position.
238	N27	12/21	Birth of small active region.
220	S20	12/29	Filament disappeared.
183	S12	12/28	Birth of active region that grew to maximum 31 December as a simple class E spot group.
179	N14	12/25	Birth of small active region.
175	S27	12/31	Large filament disappeared, in apparent response to growth of active region northwest of this location.
164	N11	12/25 12/29	Birth of active region. Important additional growth; maximum 31 December as class D spot group with large leader spot.
153	N21	1/4	Large filament disappeared at west limb; associated with old active region that had large single spot for almost all of disk passage.
129	N32	12/29	Partial disappearance of filament.
98	N23	12/28-30	Plage bright and close to leader sunspot along east-west neutral line north of the spot -- an unusual active-region configuration.
87	N03	12/29	Birth of active region at east limb that reached maximum by 1 January as class D spot group.
73	S26	1/8	Large filament disappeared near west limb.
22	S22	1/12	Birth of small active region.
18	S20	1/9	Birth of small active region.
6	S06	1/5	Maximum development, near east limb, of class E spot group with exceptionally large leader spot.

Note: Days without H-alpha photographs were 8-10 December 1970.

1971 - Rotation 1570

°Long.	°Lat.	Date	Descriptive Notes	°Long.	°Lat.	Date	Descriptive Notes
332	S13	1/9	Birth of small active region.	94	N09	1/28	a few degrees east of this location.
327	M12	1/13 1/15	Birth of small active region. Reached maximum as class C spot group and merged with adjacent region.				Birth of active region that reached maximum 31 January as class D spot group.
325	M10	1/14	Birth of small active region that merged with older region to the west.	66	N08	1/27 1/30	East limb passage of class F spot group with double leader spots. Additional growth began in the central portion of the region.
303	S18	1/11	Birth of active region that reached maximum by 13 January as class C spot group.			2/2	Maximum area and spot count of this compact class F group.
299	M19	1/15	OMP of large, single sunspot with polarity opposite to usual leader spots of Northern Hemisphere. Possibly return of reversed-polarity region of previous solar rotation but with latitude decreased by 5°.	55	N24	2/4	Birth of active region that maximized 7 February as class D spot group near west limb.
295	M18	1/15	Semicircular filament disappeared from within plage near large, single spot. Neutral line formed semi-circle concentric to the spot.	30	N23	2/6	Large filament disappeared, in apparent response to rapid growth of active region to the west. Filament had been exceptionally active throughout the disk passage.
254	M20	1/23	Filament disappeared near west limb.	15	S34	2/5-6	Filament disappeared.
222	S09 M27	1/21 1/21	Birth of very small active region. Birth of small active region.	9	M27	2/11	Large filament disappeared at west limb.
215	S06	1/19	Filament disappeared.				
212	M19	1/19 1/24	Birth of significant region on trailing border of a great class F spot group. Collision and merger between the (212, M19) group and the great region to its west on same day as major flare and proton event within the larger region. During the day preceding the collision, the leader and follower spots of the newer group rotated through 90°.				
192	M10	1/21	Maximum development of class D spot group that formed before east limb passage.				
190	M12	1/27	Birth of small region in following portion of large, decaying region.				
173	M15	1/27	Large filament formed; enlarged during the remaining 2 days of disk passage.				
158	S12	1/26	Filament became especially large and active after central meridian passage.				
133	M19	1/27	Birth of small active region.				
116	M02	1/26	Birth of small active region.				
100	M05	1/31	Area of faint plage became enhanced for 1 day only, as if responding to rapid growth of active region				

Note: There were no days without H-alpha photographs.

Last Revision 9/26/77 SLO

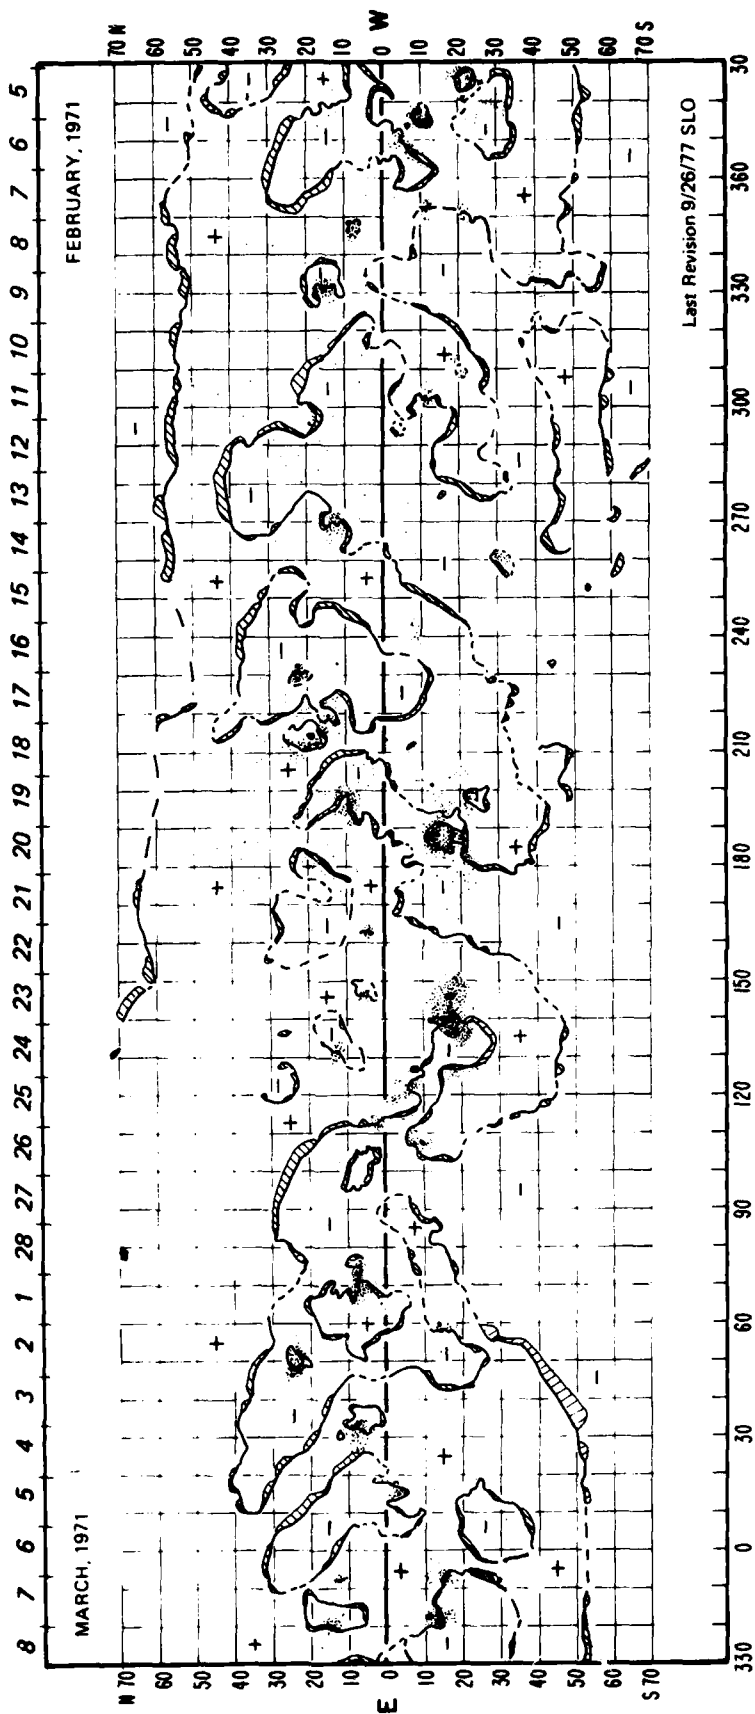

# H $\alpha$ SYNOPTIC CHART 1971 - Rotation 1571

*Long.	*Lat.	Date	Descriptive Notes	*Long.	*Lat.	Date	Descriptive Notes
352	S11	2/11	Birth of small active region.	190	S13	2/23	Large curved filament disappeared as circular neutral line in old plage rearranged and connected with large-scale neutral line to west and south of this location.
351	S21	2/11	Birth of small active region.				
346	N07	2/6	Birth of small active region.	183	N20	2/17	Large filament in semicircular pattern disappeared.
332	N15	2/6	Birth of small active region with slow growth to maximum 9 February as small class C spot group.			2/24	Filaments disappeared for second time, having re-formed gradually since 18 February.
		2/13	Additional growth to class D spot group just before west limb passage.	163	N05	2/25	Birth of small active region.
311	S20	2/11	Birth of small active region.	146	N05	2/23	Birth of small active region.
303	S12	2/10	Birth of small active region.	140	S17	2/19	Maximum development of compact class F spot group.
295	N20	2/9	Filaments over the neutral line to northeast and southwest of this spot began to elevate and became active from this day, continuing to enlarge until west limb passage 7 days later. This was third disk passage for unusual reversed-polarity region with neutral line concentric to the spot. Region showed an abnormally large spot proper motion to the east, as if associated with slow rotation of large-scale pattern north of the spot.	134	S28	2/24	Partial disappearance of curved filament near large active region.
280	S20	2/17	Filament disappeared.	131	N13	2/23	Birth of very small active region.
269	N12	2/13	Birth of active region that reached maximum 16 February as class D spot group with large leader spot.	113	N02	2/28	Birth of small active region.
252	N20	2/13	Overlying filament disappeared from neutral line pattern that had rearranged during previous solar rotation--rearranged in apparent response to passage of slow-rotating patterns north of this location.	108	S12	2/27	Formation of new area of plage on southern boundary of large, single sunspot.
		2/17	Further rearrangement of pattern occurred; convection evolved into a simple curve, becoming more like the pattern at this location on rotation 1572.			3/2	Disappearance of plage accompanied by rapid dissolution of the sunspot.
251	N22	2/19	Birth of active region that reached maximum as class D spot group 21 February, just before west limb passage.	105	N03	2/26	Birth of very small active region.
249	S13	2/15	Filament disappeared.	71	N09	3/1	CMP of peculiar spot group composed of a cluster of large leader spots with relative proper motions describing a clockwise circular pattern.
213	N19	2/18	CMP of large sunspot surrounded by strong, counter-clockwise vortical pattern. This was second disk passage of region that interacted with large spot group at time of major flare on 24 January. Remnant plage and leader spot of that great region lay west of the (213,N19) spot on this rotation.	57	S14	3/1	Birth of small active region.
				50	S39	3/3	Great filament disappeared in apparent response to growth of nearby active region.
192	S12	2/19	CMP of large isolated sunspot that had moved westward 10° since previous solar rotation (an abnormally rapid rate of solar rotation for this latitude).	49	N23	3/1	Birth of small active region on southern border of large single spot.
				48	N35	3/6	Filament disappeared near west limb.
				12	N18	3/9	Large filament disappeared near west limb.

Note: There were no days without H-alpha photographs.

# H<sub>α</sub> SYNOPTIC CHART

1971 - ROTATION 1571

H $\alpha$  SYNOPTIC CHART  
1971 - Rotation 1572

%Long.	%Lat.	Date	Descriptive Notes	%Long.	%Lat.	Date	Descriptive Notes
353	N13 S18	3/2	Birth of tiny active region without spots. Filament disappeared.	150	N20	3/22	Birth of small active region.
344	N30	3/10	Filament disappeared.	126	N31	3/21	Birth of small active region.
335	N01	3/10	Filament section visible this day only--the same day that filaments disappeared around adjacent large-scale feature in the Southern Hemisphere.	100	N25	3/20-31	Filament especially large and elevated throughout disk passage.
323 & 330	S17 & S32	3/10	Simultaneous disappearance of filaments bordering south and east portion of a large-scale cell of negative polarity.	36	N26	3/31	Birth of tiny active region that nearly vanished by 2 April.
307	S05	3/11	Birth of small active region.	515	S15	3/30	Filament encircling negative-polarity cell disappeared.
295	S07	3/8	Birth of moderate active region. Maximum development on 10 March with numerous small spots.	30	S18	3/25	Birth of peculiar and highly active region at east limb. Region developed two large symmetric spots of opposite polarity along a common meridian and separated by 4°. The northern member was of follower (negative) polarity and was encircled by a filament during almost all of the disk passage.
285	S11	3/13	Birth of small active region.	26	S14	3/29	Birth of small active region on corner of negative-polarity cell involved with peculiar active region at (30,S18).
265	S15	3/7	East limb passage of moderate active region with large class D spot group and unusual negative slope to group axis; leader spot was at higher latitude than the follower. The axis slope became more extreme during the disk passage, with the large symmetric leader spot moving from S14 to S18. The follower spots diminished during this time, and became almost due north of leader on the day of last visibility (16 March). Occasionally dark surges occurred south of the leader sunspot.	25	S18	4/5	Birth of additional active region on border of cell involved with peculiar active region.
	N30	3/10	Large filament disappeared.				
245	S11	3/16	Birth of small active region.				
240	N20	3/12	Minor growth of existing active region with class C spot group.				
239	S04	3/16	Birth of moderate active region that grew rapidly to maximum size as class C spot group with large leading sunspot.				
232	N08	3/12	Birth of small active region without spots.				
208	N30-45	3/19	Large filaments on northeast corner of large-scale negative-polarity cell disappeared together.				
206	N22	3/16	Portion of filament temporarily formed high above neutral line, giving the appearance of two closely-spaced neutral lines.				
184	S21	3/21-24	Filament became large and elevated toward end of disk passage.				
152	S16	3/18	Birth of moderate active region that attained maximum as a small class D spot group by 21 March.				

Note: There were no days without H-alpha photographs.

# H $\alpha$ SYNOPTIC CHART

1971 - ROTATION 1572

# H $\alpha$ SYNOPTIC CHART 1971 - Rotation 1573

°Long.	°Lat.	Date	Descriptive Notes	°Long.	°Lat.	Date	Descriptive Notes
261	S15	CHP 4/10	Active region intermittently isolated and combined with large positive-polarity cell to its north. Leader sunspot was at S14 latitude, having moved from S18 since the previous disk passage (see notes for rotation 1572). Leader sunspot disappeared.	150	N19	4/13	Active region embedded in the trailing portion of a large, inactive region, appeared young and growing at east limb. Major flare (2b) with x-ray burst of class X occurred on this day. This region had the highest flare index for month of April ( <i>Solar-Geophysical Data</i> ). Small region born that modified adjacent neutral line. Spot group did not exceed class B.
253	N15	4/15	Filament disappeared.	138	S08	4/21	Birth of minor active region that reached maximum on 20 April with small spot; nearly dissipated by 24 April.
248	N15	4/11	Small circular filament disappeared.	124	N13	4/19	Great filament developed during almost all of the disk passage along a large-scale +/- neutral line that coincided with a +/- sector boundary in the interplanetary magnetic field.
228	S11	4/9	Filament disappeared.	95	S28	4/19	Filament disappeared.
220-290	N40	4/12	Great filament disappeared.	79	S11	4/18	Small active region probably born near east limb on, or the day before, this date. Complex active filament associated with the region on this date. Region dissipated throughout the disk passage. Spots were very small and visible first 4 days only.
216	S04	4/13	Birth of active region 10° west of developing region. New region attained class D spot group by 14 April.	45	S10	4/23	Associated filament became especially large. Birth of active region that attained maximum on 25 April as a small class D spot group.
215	N21	4/19	Birth of small active region just before west limb passage.	41	N07	4/25	Birth of tiny region that disappeared by 28 April.
210	N20	4/19	Large filament disappeared as small region formed 5° west of this location.	35	S37	CHP 4/27	Filament was especially large during entire disk passage, becoming extremely elevated west of central meridian.
206	S03	4/11	Birth of active region that reached maximum development on 14 April as a class D sunspot group.	34	S12	4/24	Birth of active region within remnants of complex region of previous solar rotation. Maximized as small class D spot group and encountered plage of region to its west on 26 April.
192	S22	4/13	Filament disappeared.	30	N07	4/24	Birth of active region that reached maximum on 28 April as a moderate class D spot group.
190	S42	4/19	Faint plage visible this day only.	25	N06	4/30	Semicircular filament formed around follower sunspots.
187	S15	4/14	Birth of small active region that dissipated by 19 April.	10	N02	4/26	Filaments disappeared, as neutral line underwent rapid motion and rearrangement.
171	S08	4/16	New growth within large active region with simple spot and plage structure. Relative motion among leader spots exhibited pattern of rotation through 90° during 3 days before this new growth. Plage developed surrounding leader sunspot and leader spots dissipated. Mergers of this new plage with existing plage extended neutral line along a curved path that paralleled the rotary motion of the leader spots. Follower spot of region to the north and on opposite side of the solar equator dissipated simultaneously with leader of this region. The spots were of the same polarity.		N19	4/29	Filament disappeared.
168	N10	4/20	Filament disappeared.				
	S19	4/20	Filament south of active region disappeared.				
160	N20	4/18	Plage developed around leader sunspot.				
		4/19	Leader sunspot rapidly decayed.				
		4/20	Plage and small spots developed near site of old spot.				

Note: There were no days without H-alpha photographs.

1971 - Rotation 1574

*Long.	*Lat.	Date	Descriptive Notes	*Long.	*Lat.	Date	Descriptive Notes
344	S04	4/25	Probable date of birth of active region at east limb that grew to maximum on 27 April as class D spot group.	32	N16	5/19	Probable date of birth of small active region at east limb.
342	S12	4/29	Birth of tiny active region south of large region.	25	S07	5/26	Birth of large active region that reached maximum on 28 May as class E spot group.
335	N39	5/1	Filament disappeared.	19	S18	5/30	Birth of small active region near west limb.
320	M18	5/1	Birth of small active region in leading portion of faint plage.				
301	M15	5/3	Birth of small active region.				
270	M13	5/1	Probable date of birth of major active region at east limb. Grew to maximum by 7 May as complex class E spot group. Developed two widely separated leader spots that moved together and merged to form large single spot by 9 May.				
262	N27	5/10	Filament disappeared as neutral lines in vicinity re-arranged to form pattern observed near this location on next solar rotation.				
213	M06	5/13	Birth of small active region.				
195	M19	5/12	Birth of small active region.				
190	S08	5/15	Birth of small active region beneath large filament was followed by eruption of the filament.				
185	S03	5/11	Filament disappeared near following portion of active region. Distinct vortical development with a clockwise twist surrounded this region's follower spot.				
183	M18	5/18	Filament disappeared near west limb.				
157	M16	5/12	Filament disappeared near east limb.				
150	S29	5/18	Filament disappeared.				
140	M11	5/15	Birth of small active region.				
134	M04	5/14	Maximum development of peculiar class D spot group with main spot in center of compact cluster of small spots.				
110	S14	5/18	Filament disappeared.				
70	S22	5/18	Filament disappeared.				
60	M18	5/20	Large active filament developed within small active region.				
		5/21	Filament disappeared, followed by rapid dissolution of the active region during next few days.				
45	N25	5/26	Partial disappearance of large filament.				

Note: There were no days without H-alpha photographs.

1971 - ROTATION 1574

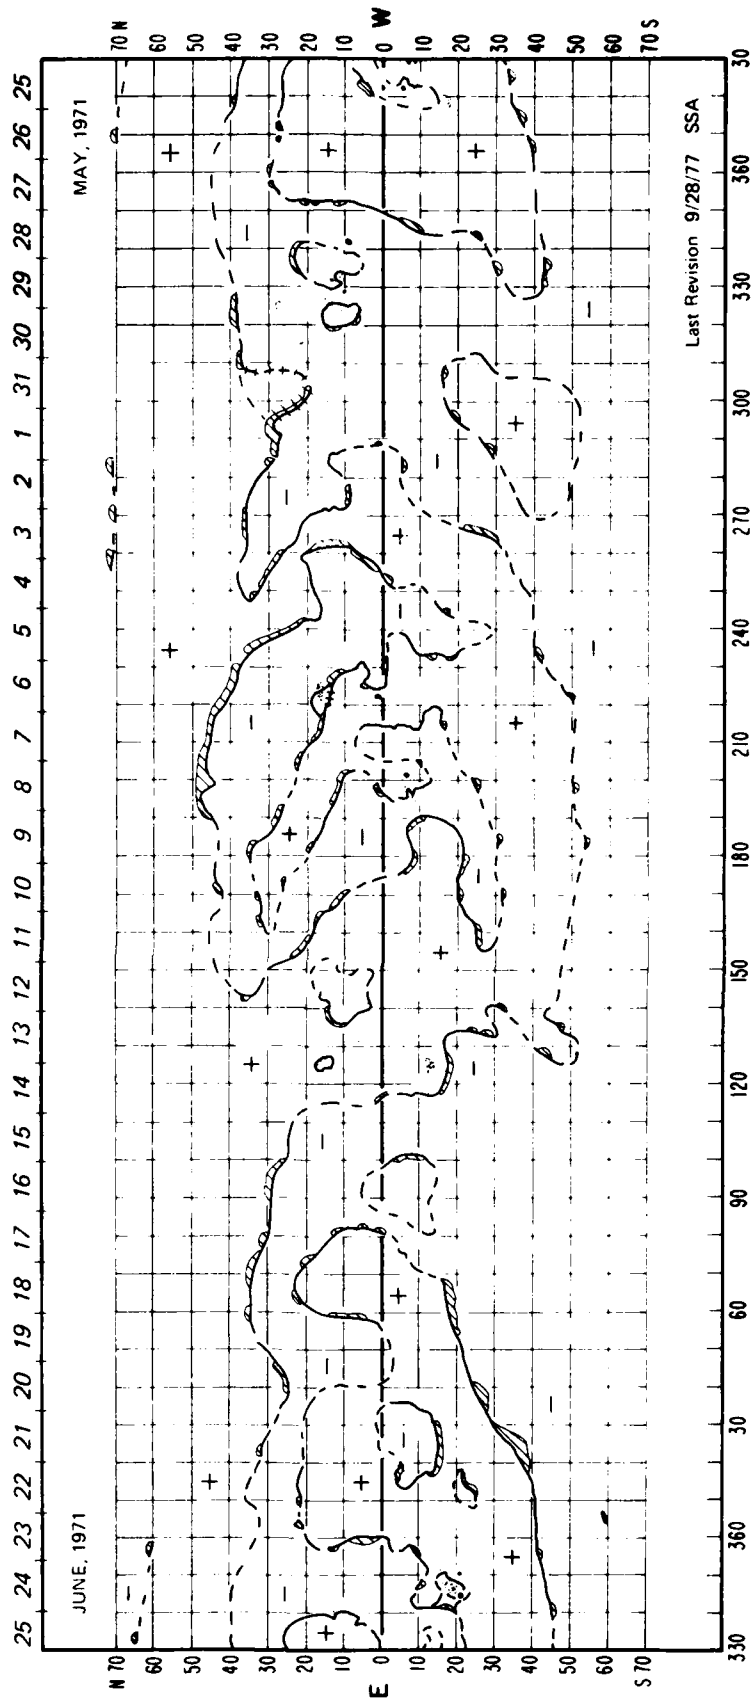

H $\alpha$  SYNOPSIS CHART  
1971 - Rotation 1575

*Long.	*Lat.	Date	Descriptive Notes
336	N11	5/24	Birth of active region near east limb; reached maximum as an open class E spot group with large leader spot.
325	N10	5/28	Birth of small active region at trailing edge of large active region.
320	N10	5/30	Filament formed on trailing boundary of growing active region.
260	N07	6/6	Filament disappeared.
228	N13	6/3	Filament disappeared; re-formed 5-6 June.
		6/8	Disappeared on day of birth of nearby active region.
224	N17	6/8	Birth of small active region.
220	N40	6/10	Great filament disappeared near west limb.
219	S14	6/7	Birth of small active region.
160	S25	6/8	Filament disappeared.
145	N18	6/11	Birth of small active region.
125	S12	6/14	Birth of small active region.
124	N15	6/17	Birth of small active region.
101	S08	6/14	Filament disappeared.
80	S12	6/16	Birth of tiny active region.
		6/20	New region emerged at same coordinates.
		6/22	Reached maximum as class D spot group with bright plage last day of disk passage.
75	S06	6/16	Birth of small active region.
60	N35	6/20	Filament fragments disappeared.
59	N09	6/18	Filament disappeared.

Note: There were no days without H-alpha photographs.

345	N16	8/14	Birth of small active region in trailing portion of old plage.	43	S09	9/10	Birth of small active region.
294	N19	8/19	Birth of small region in leading portion of old plage.	30	N21	9/9	Filament disappeared; re-formed next day.
289	N11	8/23	Birth of active region on southern border of old plage.			9/13	Filament disappeared again.
		8/25	Maximum development as class B spot group in bright plage.	25	N01	9/10	Filament disappeared.
270	S12	8/22	Maximum development near central meridian of one of the largest class F spot groups of the solar cycle. Region notable for source of great dark surges on same day that one leader sunspot penetrated another. Conspicuous clockwise pattern to relative motions among the leader spots. Region surrounded by large, active filaments. Source of large proton flare after west limb passage.	24	N05	9/9	Birth of small active region.
				23	S18	9/14	Filament disappeared.
252	M45	8/24	Filament disappeared.	22	S29	9/6	Birth of tiny active region near east limb.
233	S06	8/19	Probable date of birth of active region at east limb.				
		8/23	Maximum development as class D spot group.				
		8/27	Growth of plage surrounding large leader spots. Follower spots had disappeared by this date.				
179	S39	8/27	Filament disappeared near east limb.				
140	N31	9/3	Filament disappeared.				
135	M45	8/28	Filament disappeared near east limb.				
129	N02	9/5	Birth of active region that grew to maximum on 8 September as large class D spot group. West limb passage next day.				
126	S10	9/4	Large, curved filament disappeared in response to growth of active region nearby.				
120	S08	9/1	Birth of active region that grew to maximum on 6 September as class E spot group with large leader spot.				
97	N18	9/4	Birth of small active region.				
		9/9	Additional minor growth.				
82	M19	9/5	Birth of small active region.				
	N23	9/7	Filament disappeared in apparent response to minor growth in nearby active region.				
70	S18	9/9	Large filament disappeared.				

Note: There were no days without H-alpha photographs.

# H $\alpha$ SYNOPTIC CHART

1971 ~ ROTATION 1578

H $\alpha$  SYNOPTIC CHART  
1971 - Rotation 1579

*Long.	*Lat.	Date	Descriptive Notes	*Long.	*Lat.	Date	Descriptive Notes
352	S37	9/12	Filament disappeared; re-formed 13 September and remained for rest of disk passage.	137	Equator	9/24	Birth of small active region.
326	N25	9/14	Large filament disappeared.	119	S05	9/25	Probable date of birth of active region at east limb and on trailing border of large returning region. Grew to maximum on 29 September as small class D spot group.
319	N12	9/16	OMP of isolated, leader sunspot that had returned for its third disk passage with virtually no attendant plage.	106	S31	10/3	Large filament disappeared.
313	N13	9/21	Birth of small active region near west limb and near site of isolated, old leader spot that had disappeared by previous day.	102	N46	10/1	Filament disappeared.
306	N19	9/17	Filament disappeared.	97	N24	10/4	Filament disappeared within faint active region.
300	S03	9/23	Birth of small active region at west limb.	79	N11	10/3	Large proton flare in simple class C spot group with large leader spot. Group had been class E near east limb. Group axis inclined to equator at unusually large angle.
295	N13	9/16 9/20	Birth of small active region within small, faint plage. Emergence of third region at this location. Grew rapidly to class D spot group on 21 September with negative inclination to group axis, i.e., with leader at higher latitude than follower spot.	73	S09	9/30 10/5	Birth of small active region at east limb. Second region emerged in leading portion of first, growing somewhat larger than earlier region.
282	N03	9/16	Plage and small spots developed near large leader spot for next 4 days.	71	S03	10/4	Birth of small active region.
275	S13	9/13	East limb passage of great region returned for second disk passage. Consisted of two overlapped regions--a second region had formed south of the old leader spot since west limb passage 2 weeks earlier. Clockwise proper motions occurred among leader spots. Extensive plage developed north of the leader since previous disk passage. Small spots throughout the large plage decayed steadily during this disk transit.	63	S06	10/11	Birth of small active region at west limb.
248	S05	9/17	Large filament disappeared near east limb.	37	S26	10/9	Large filament disappeared.
232	S07	9/18	Birth of small active region near east limb.	29	S20	10/10	Birth of tiny active region.
205	S12	9/21	Filament disappeared.	0	S28	10/7	Filament disappeared from southern portion of faint region. Re-formed next day.
196	S16	9/22	Filament disappeared in response to growth of nearby active region and rearrangement of underlying neutral line.			10/12-13	Disappeared again at time when large filament disappeared on same neutral line east of this location.
190	S14	9/21	Birth of active region that caused extensive rearrangement of neighboring neutral lines as the region expanded. Reached maximum development on 27 September as a class D spot group.				
145	N25	9/25	Filament disappeared near east limb.				
138	N14	9/26	Filament disappeared in apparent response to growth of nearby active region.				

Note: Day without H-alpha photographs was 12 October 1971.

## 1971 - ROTATION 1579

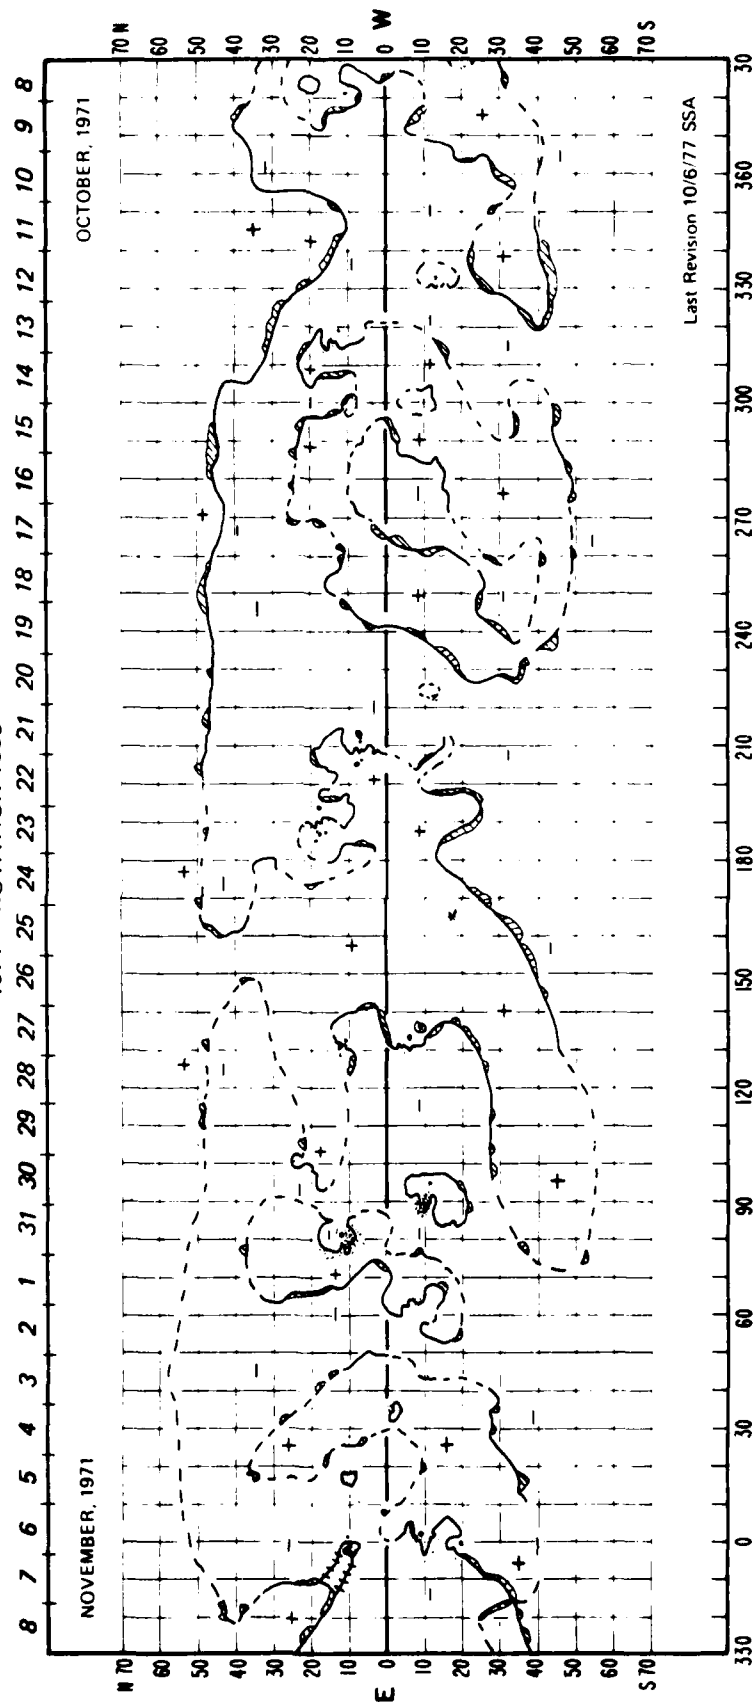

H $\alpha$  SYNOPTIC CHART  
1971 - Rotation 1580

*Long.	*Lat.	Date	Descriptive Notes	*Long.	*Lat.	Date	Descriptive Notes
330	S13	10/10	Birth of active region that reached maximum on 15 October as class B spot group.	90	S10	10/28	Birth of active region with slow initial development
328	S32	10/12-13	Large, semicircular filament disappeared, in apparent response to growth of nearby active region.			10/31	Beginning of more rapid growth.
313	S13	10/12-13	Filament disappeared.			11/2	First maximum development as small class D spot group; spots declined rapidly next day.
30	M10	10/11	Birth of small active region.			11/4	Additional growth just before west limb passage formed follower-dominant class C group.
297	M13	10/11	Filament disappeared in response to birth of small active region under filament.	84	S18	10/29	Birth of small active region that merged with larger region northwest of this position. This small complex of activity was the precursor to the series of great active regions that formed in this location during the next 7 rotations.
287	M45	10/12-13	Filament disappeared; re-formed by 17 October.				
280	S17	10/17	Faint plage on south side of neutral line brightened for 3 days, taking form of a ribbon. This area was remnant of great active region of rotation 1578.	81	M11	10/31	OMP of large single spot with strong vortical pattern to fibrils surrounding the spot and counterclockwise sense of twist. Marked return of proton-flare region of previous disk passage.
204	S12	10/19	Birth of small active region.	75	S08	10/28	Filament disappeared.
272	M07	10/17	Birth of small active region.	66	N20	11/1	Large filament disappeared; began re-forming next day.
262	S05	10/16-17	Filament disappeared.	43	S10	11/1	Birth of small active region.
213	S12	10/20	Birth of small active region.	25	S30	11/8	Filament disappeared near west limb.
208	M08	10/15	Probable date of birth at east limb of active region that grew to maximum 23 October as a great class E spot group with both leader and follower attaining a large and symmetric form.	18	M10	10/31	Birth of small active region near east limb.
197	S15	10/19	Large filament disappeared in apparent response to birth of nearby active region.	11	M08	11/10	Birth of small active region near west limb.
190	M18	10/19 10/23	Birth of active region with slow initial development. Beginning of rapid growth, with maximum by 25 October as large class D spot group.				
133	S06	10/25	Complex pattern of fibrils, absorption features and plage formed around large returning sunspot and remained active for next 5 days.				
		10/31	Important plage growth with small new spots occurred around the spot, especially next to its western edge.				
130	M12	10/23	Birth of small active region near east limb. Grew to maximum by 26 October as large class B spot group.				
93	S19	10/27 10/29	Filament disappeared; re-formed next day. Filament disappeared again in apparent response to growth of nearby active regions; filament did not re-form.				

Note: Days without H-alpha photographs were 12 and 16 October 1971.

# H $\alpha$ SYNOPTIC CHART

1971 - ROTATION 1580

Last Revision 10/6/77 SSA

H $\alpha$  SYNOPTIC CHART  
1971 - Rotation 1581

$^{\circ}$ Long.	$^{\circ}$ Lat.	Date	Descriptive Notes	$^{\circ}$ Long.	$^{\circ}$ Lat.	Date	Descriptive Notes
360	S15	11/6	CMP of pair of active regions on a common neutral line and situated north-south of one another. Each contained large leader spots that decayed slowly during the disk passage. These regions had formed on the backside of the sun, precisely on an existing, large-scale neutral line that had been present since rotation 1574. East limb transit occurred on 31 October. This particular +/- magnetic boundary remained identifiable near these coordinates through at least the fraction of rotation 1617 (July 1974) that this atlas contains. This large-scale feature therefore persisted for at least 44 solar rotations.	181	S05	11/20	CMP of extremely active filament.
359	N09	11/4	Maximum development of class C spot group born at, or just before, east limb passage on 31 October. Neutral line east of region rearranged, isolating the region from the neighboring large-scale pattern.	145	S35	11/23	Great filament disappeared.
326	N10	11/7	Birth of small active region.	119	N14	11/21	Birth of small active region.
323	S30	11/6	Filament disappeared.	107	N08	11/23	Birth of small active region.
297	N16	11/11	Filament partially disappeared from within faint plage.	93	N18	11/30	Birth of small active region near west limb.
296	S19	11/12	Semicircular filament, associated with faint plage, disappeared.			11/22	Filament partially disappeared near east limb; re-formed during next 2 days.
294	S03	11/8	Birth of small active region.		S09	11/26	Disappeared again.
283	N26	11/13	Remaining portion of filament disappeared.			11/23	Birth of active region between two faint regions near east limb. Grew to first maximum on 24 November as small class C spot group.
266	N21	11/17	Filament disappeared.		S01	11/27	New growth to small class D spot group. Formed intense filament present 1 day only.
262	S11	11/17	Birth of active region that grew to maximum next day as class C spot group.	90	S17	11/28	Peak development of complex class E spot group that formed the most important member of large activity complex.
238	S14	11/20	Great filament disappeared near west limb.	83	S09	11/23	Birth of small active region.
233	N10	11/21	Birth of active region near west limb on leading edge of large, faint plage. Growth continued during west limb passage next day.			11/26	New region merged with regions west and south to form important activity complex.
209	S18	11/17	Large, curved filament present 1 day only with center of curvature located at large sunspot at (193,S13).	81	N14	11/26	Peak development of large, compact class D spot group with polarity arrangement reversed from normal for Northern Hemisphere in this even-numbered solar cycle. Followed spots of new group had been leader spots of strong region during previous two disk passages. The large class D spot group reestablished a major +/- boundary -- one that had first formed on rotation 1541 near a strong proton flare region. This boundary persisted throughout the remainder of the period described by this atlas (rotation 1616) and was involved with reversed polarity regions of exceptional activity on rotations 1600-1602. Total lifetime of the boundary may have exceeded 76 solar rotations.
196	S10	11/19	Birth of active region near western edge of great sunspot. Grew slowly to maximum on 24 November near west limb as class D spot group.	62	N15	11/26	Birth of small active region.
190	S01	11/15	Filament disappeared near east limb.	55	S08	11/28	Filament fragments disappeared from neutral line segment between the solar equator and S20.
	N16	11/16	Narrow filament disappeared from within faint plage; southern portion re-formed and became active next day.		S18	12/5	Birth of small active region near west limb.
	S13	11/19	Re-formed southern portion of filament disappeared. CMP of active region notable for its extremely large, symmetric leader spot; for its neutral line concentric to, and nearly encircling, the spot; and for its plage almost entirely confined to the trailing half of the region. Vortical pattern to fibrils around the spot with clockwise sense of twist. This great spot returned on next rotation very much diminished.	37	S10	12/2	Birth of active region that grew to class C spot group by next day and merged with small, older region east of this location.
				31	S16	11/27	Birth of small active region near east limb.
				28	N10	12/4	Almost all of filament disappeared.

Note: There were no days without H-alpha photographs.

# H<sub>α</sub> SYNOPTIC CHART 1971 - ROTATION 1581

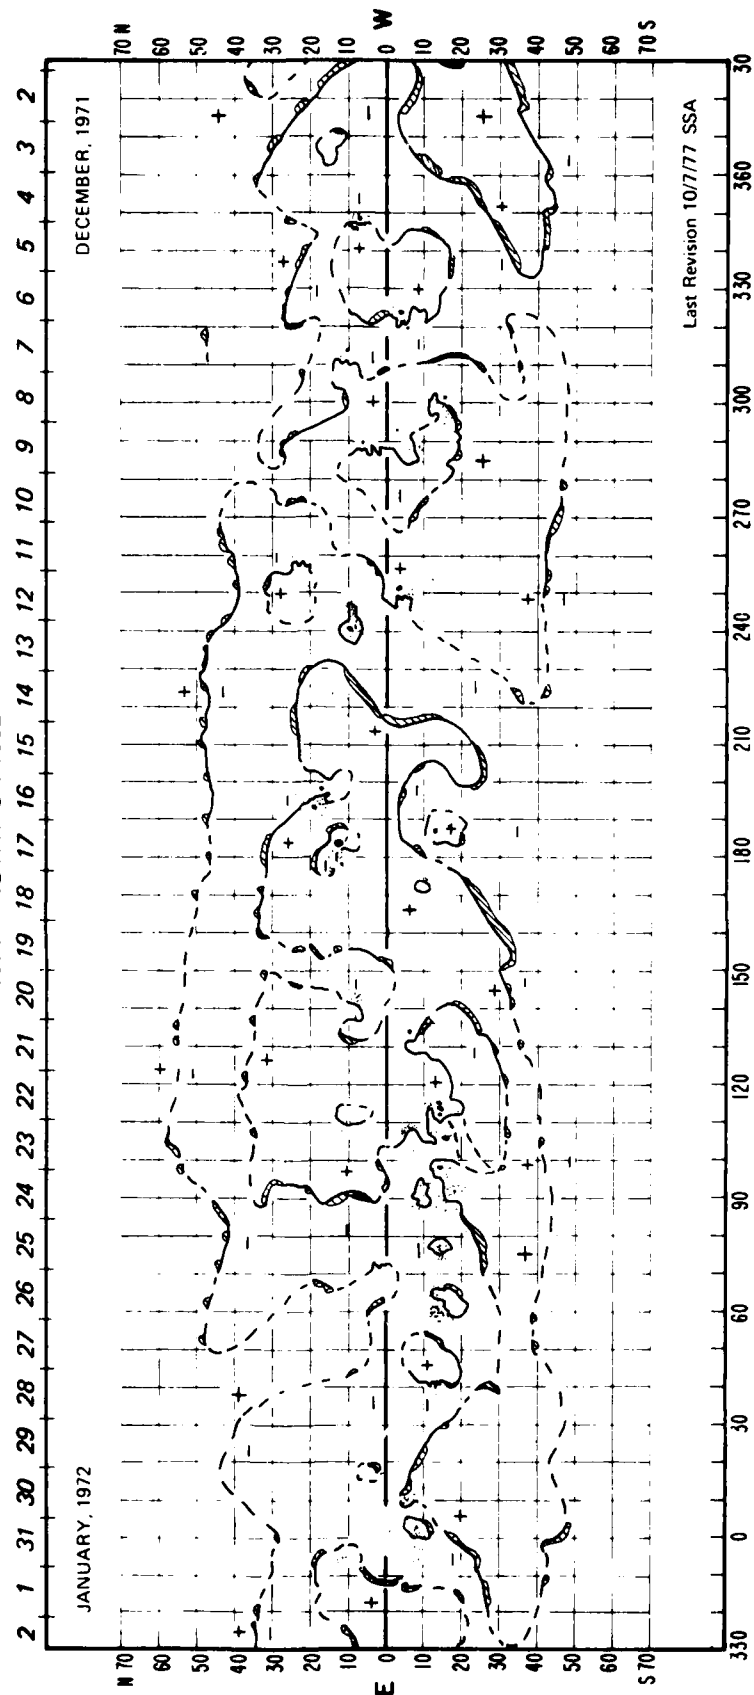

H $\alpha$  SYNOPTIC CHART  
1971 - Rotation 1582

°Long.	°Lat.	Date	Descriptive Notes	°Long.	°Lat.	Date	Descriptive Notes
347	N08	12/4	Birth of active region that grew to maximum by next day as class D spot group.	180	N12	12/16	Rapid growth began; maximum occurred 18 December as large class D spot group.
		12/9	Additional growth near west limb.				
331	S16	12/4	Birth of small active region.	173	S10	12/18	Birth of small active region.
		12/8	Second small region emerged at this location with brighter plage.	141	N09	12/15	Probable date of birth at east limb of small active region.
322	S04	12/6	Maximum development of large class D spot group with group axis inclined to equator at angle larger than normal. The inclination was consistent with the orientation of the large-scale neutral line extending southwest from the region. Large-scale neutral lines normally extend southeast from active regions in the Southern Hemisphere.	137	S10	12/17	Filament disappeared.
				133	S06	12/21	CMF of large, single sunspot that had returned from previous disk transit with virtually no attendant plage.
321	M15	12/5	Filament disappeared near east limb.	111	S14	12/20	Maximum development of simple, large class E spot group --one that formed western portion of a great activity complex.
		12/8	Birth of small active region.				
310	M10	12/5	Birth of small active region.	105	S11	12/26	Minor plage growth near west limb.
		12/9	Additional growth.	95	S14	12/19	Birth of major active region near northern edge of a small leader spot. The new group emerged along the neutral line and within the remains of a large region that had returned from the previous rotation. The old spot slowly diminished, as this new region developed in a rapid and unusual fashion. Instead of a bipolar pair of small spots, the initial spots lay within a single, symmetric penumbra. This penumbra enlarged and became more irregular, and new follower spots formed to its east on 21 December. The group attained maximum development on 24 December as a compact class D group of normal orientation. By this time the original sunspot had disappeared. Forming a semicircle around the leader spot, the neutral line appeared as a conspicuous corridor within brilliant plage. Its distinctive pattern continued for the next 3 solar rotations.
300	S15	12/5	Birth of small active region.				
297	S15	12/12	Birth of small active region near west limb in trailing portion of older region.				
290	N28	12/5	Filament disappeared near east limb.				
285	S09	12/9	Birth of small active region on trailing boundary of small faint plage.				
278	N07	12/8	Birth of active region that grew to maximum next day as large class B spot group.				
272	S09	12/12	Filament disappeared.	94	S10	12/27	Birth of small active region on northern edge of great activity complex.
245	N09	12/11	Maximum development of follower-dominant class D spot group with brilliant, compact plage. Neutral line encircled the follower spot and lay east-west within the compact plage--a configuration often associated with high flare activity.	90	N12	12/27	Great filament disappeared within faint remnants of reversed-polarity region.
		12/16	Filament formed around follower spot.	79	S25	12/26	Filament disappeared from southern edge of great activity complex.
		12/18	Embedded filament disappeared at west limb.				
218	N01	12/15	Great equator-crossing filament disappeared, perhaps as part of process of major rearrangement of neighboring magnetic patterns. This rearrangement ended one long-lived pattern and established a new one which endured for many rotations.	75	S14	12/23	Birth of small active region.
				64	S12	12/21	Birth of small active region near east limb.
216	N24	12/16	Filament disappeared; re-formed during next 2 days.	60	S14	12/29	Birth of active region that grew to maximum 31 December as class C spot group.
		12/19	Disappeared again near west limb.	40	Equator	12/23	Filament disappeared near east limb.
204	S25	12/14	Curved filament disappeared; re-formed next day.	S25	S25	12/28	Filament disappeared.
195	M18	12/12	Peak development of large class D spot group.	20	S08	12/30	Filament disappeared.
182	N32	12/15	Large filament disappeared.				
180	N12	12/12	Birth of active region at east limb with slow initial growth.	19	N02	1/3	Filament disappeared in apparent response to growth of active region east of this location; re-formed next day.
				0	S09	12/27	Filament disappeared near west limb.
						12/28	Small filament disappeared.
							Birth of active region that grew to maximum by 31 December as small class D spot group.

Note: There were no days without H-alpha photographs.

# H $\alpha$ SYNOPTIC CHART 1971 - ROTATION 1582

# H $\alpha$ SYNOPTIC CHART 1971-1972 - Rotation 1583

$^{\circ}$ Long.	$^{\circ}$ Lat.	Date	Descriptive Notes	$^{\circ}$ Long.	$^{\circ}$ Lat.	Date	Descriptive Notes
353	N13	1/5	Birth of small active region near west limb.	119	N20	1/14	Birth of very small active region near east limb; disappeared by 18 January.
325	N07	1/5	Filament disappeared in apparent response to growth of active region northeast of this location.	112	S17	1/20	Birth of active region near neutral line that lay within remnants of large active region. Developed into reversed-polarity class D spot group by 22 January. Group axis was inclined strongly to equator at a negative angle, i.e., leader spot lay at higher latitude than follower. This unusual inclination was consistent with the associated large-scale neutral line orientation that was itself opposite to the normal orientation for the Southern Hemisphere. Growth of this region resulted in rearrangement of neutral line south of the region, creating an isolated cell of positive polarity. Group rapidly diminished to single tiny spot by west limb on 24 January.
316	N09	1/4	Birth of active region that grew to small class D by 5 January and formed important complex with region 3 $^{\circ}$ north.				
	N12	1/5	Birth of small active region that merged with region to its south to form important complex.				
	N20	1/6	Birth of small active region.				
315	S22	1/7	Portion of large filament disappeared.				
292	S22	1/1	Birth of small active region.				
	S09	1/5	Birth of small active region.				
280	N18	1/9	Birth of small active region.	111	S11	1/13	Birth of small active region at east limb within remnant plage of large active region. Indistinguishable from old plage by 18 January.
265	S16	1/1	Probable date of birth of small active region at east limb.				
262	S01	1/6	Large filament disappeared; re-formed after 9 January.	105	N16	1/14	Probably date of birth of small active region at east limb; slow initial development.
252	S12	1/4	Filament disappeared near east limb.			1/19	Rapid growth began.
225	N43	1/7	Large filament disappeared.			1/22	Maximum development of class D spot group.
220	S12	1/9	Birth of small active region that maximized by 12 January as a follower-dominant class C spot group.	100	S32	1/19	Large filament disappeared south of great, reversed-polarity active region. Gradually re-formed during remainder of disk passage.
205	S21	1/11	Filament disappeared; as it erupted, the filament was observed at high latitudes in projection against the solar disk.	93	S15	1/20-21	OMP of large, brilliant, reversed-polarity region -- the midpoint of the fourth and most active transit of an exceptional activity complex. During this disk passage, the spot group was highly variable: an unusual region with significant spot growth occurring in the southern portion. The plage became particularly complex after 22 January. It is a region noted for the large white-light coronal transients detected by the OSO-7 spacecraft during earlier solar rotations. The principal follower sunspot -- of "leader" polarity for the Southern Hemisphere -- returned for the next 2 solar rotations. The surrounding large-scale neutral-line pattern retained its distinctive shape during these two 27-day periods. Furthermore, the large-scale magnetic pattern south of the region, at latitude 40 $^{\circ}$ , rotated at the same rate as the spot group, as if "connected" to it. This area slowed to the normal rate for latitude 40 $^{\circ}$ after the spot group disappeared.
193	N06	1/11	Filament disappeared from southern border of faint plage.				
188	S10	1/12	Maximum development of class C spot group.				
185	N12	1/16	Filament disappeared within faint plage.				
179	S08	1/18	Birth of small active region near west limb.				
152	S12	1/21	Birth of tiny plage near west limb.				
134	S25	1/15	Filament disappeared.				
126	N04	1/15	Small filament disappeared; re-formed at higher latitude on 23 January near west limb.				
124	N18	1/21	Birth of active region. Grew rapidly to class D spot group by next day; little diminution by west limb passage on 24 January. Leader spot returned for next disk passage.	54	S13	1/23	Birth of small active region on trailing edge of small plage present since east limb; declined after 24 January.

Note: There were no days without H-alpha photographs.

°Long.	°Lat.	Date	Descriptive Notes
54	S13	1/27	New growth began, continuing through west limb passage on 29 January. Attained small class D spot group by that time.
45	S07	1/21	Birth of small active region with slow initial development.
		1/24	Rapid growth began late in this day. Maximum area occurred on 27 January as class D spot group.
	S17	1/29	Plage blended with growing region to southwest.
		1/24	Birth of active region that grew to maximum on 27 January as follower-dominant class C spot group.
31	N15	1/27	Filament disappeared.
25	S15	1/22	Filament formed.
		1/29	Filament disappeared.
20	N18	1/29	Birth of small new region on northern edge of plage that had nearly disappeared by this date.
18	N13	1/25	Growth within small plage.
13	N11	1/30	Birth of active region that continued to grow through west limb passage on 1 February, but had not exceeded class B spot group by that date. Returned next rotation as part of a great spot group.
11	N14	1/28	Filament disappeared; re-formed on 29 January.
		1/31	Filament disappeared again near west limb.
6	S15	1/31	Filament disappeared.

Note: There were no days without H-alpha photographs.

# H $\alpha$ SYNOPTIC CHART 1972 - Rotation 1584

$^{\circ}$ Long.	$^{\circ}$ Lat.	Date	Descriptive Notes	$^{\circ}$ Long.	$^{\circ}$ Lat.	Date	Descriptive Notes
354	S05	1/27-29	Filament gradually disappeared.	205	N15	2/8	Large filament disappeared; gradually re-formed during next 3 days.
351	S06	1/28	Birth of small active region near filament.	190	S23	2/12	Filament disappeared; re-formed next day.
345	S48	2/1	Filament disappeared.	184	N25	2/7	Almost all of large filament disappeared; remainder gone by 9 February. Re-formed by 14 February at west limb.
339	S14	1/25	Maximum development of class C spot group with follower spot dominant.	165	N12	2/9	Almost all of filament disappeared; partially re-formed next day.
		1/30	New growth, with second maximum next day as class D group.				All of filament disappeared.
310	N10	1/28	Birth of small plage within small, old plage.	149	S32	2/11	Filament disappeared.
		1/31	Third period of growth for this small region.	144	N12	2/11	Almost all of filament disappeared; remainder gone next day.
		2/2	Beginning of rapid growth, with maximum 4 February as class D spot group.	142	S08	2/7	Probable date of birth at east limb of active region that reached maximum 11 February as class C spot group.
		1/31	Filament formed.	135	N04	2/11	Curved filament formed.
309	S11	2/1	Birth of active region that grew to small follower-dominant class C spot group by 3 February.			2/15	Filament disappeared; re-formed as large structure at west limb.
		2/2	Filament disappeared in response to growth of nearby active region.	122	N20	2/12	Birth of new spots and plage near north edge of large sunspot.
308	S27	1/29	Filament disappeared.			2/17	Large filament disappeared.
278	S35	1/31	Filament disappeared.	120	N15	2/15	OMP of neutral line outlined by filament that was notably curved concentric to large, single sunspot.
275	N07	1/30	Filament disappeared; re-formed next day.				Birth of small active region near west limb.
		2/1	Filament disappeared in apparent response to birth of nearby active region; re-formed by 3 February.	112	N18	2/19	Large filament disappeared on western boundary of great activity complex but re-formed next day. It disappeared in apparent response to plage and spot growth nearby.
		2/4	Filament disappeared as nearby active region grew.	103	S22	2/15	Formation of small new active region within important, reversed-polarity activity complex. The new group emerged west of the principal sunspot simultaneously with birth of major new active region at (90,S20) on opposite side of the same spot. Maximized next day as class C spot group.
260	S16	2/6	Filament disappeared in response to growth of nearby active region.	100	S17	2/14	East limb passage of great, reversed-polarity region that had returned for its fifth disk transit. Rapid and complex evolution occurred during first half of disk passage.
253	S19	2/5	Birth of active region near filament. Maximum next day as class C spot group with group axis at negative inclination to solar equator, i.e., with leader spot at higher latitude than followers.				Filament encircling small single sunspot disappeared.
252	S09	1/31	Birth of small active region near east limb; disappeared by 8 February.	95	S18	2/10	Birth of major active region in trailing portion of great activity complex. This region and new spots at (100,S17) on opposite side of nearby large sunspot, emerged simultaneously. Region grew rapidly to maximum by 16 February as large class D spot group.
		2/10	Birth of active region at west limb near this position.				
245	S20	2/9	Filament formed and enlarged during remaining 2 days of disk passage.				
242	N10	2/5	Filament disappeared.				
237	Equator	2/6	Filament disappeared.				
230	N40	2/6	Filament disappeared.				
226	S19	2/7	Small filament disappeared near faint plage.				
223	S08	2/6	Birth of small active region.

H $\alpha$  SYNOPTIC CHART  
1972 - Rotation 1584 (Continued)

°Long.	°Lat.	Date	Descriptive Notes
60	S06	2/14	Birth of active region on northern border of bright plage near east limb. New spots grew to class C by 17 February. Spots in older plage apparently formed from merger of two small regions, so that complex grew to have appearance of three regions on a common north-south neutral line.
40	N12	2/23	Birth of small active region.
32	S14	2/17	Rapid growth within plage near east limb, reaching maximum by 29 February as class E spot group. Formed a large complex with plage to west that contained 3 spot groups.
20	N10	2/19	Maximum development of a great class F spot group. Large leader spot divided on this date and the components diverged.
5	N11	2/22	Birth of small active region near eastern border of the extensive fibril field that emanated from the great class F spot group plage. New region grew slowly until 27 February and contained only small spots.

# H $\alpha$ SYNOPTIC CHART 1972 - Rotation :585

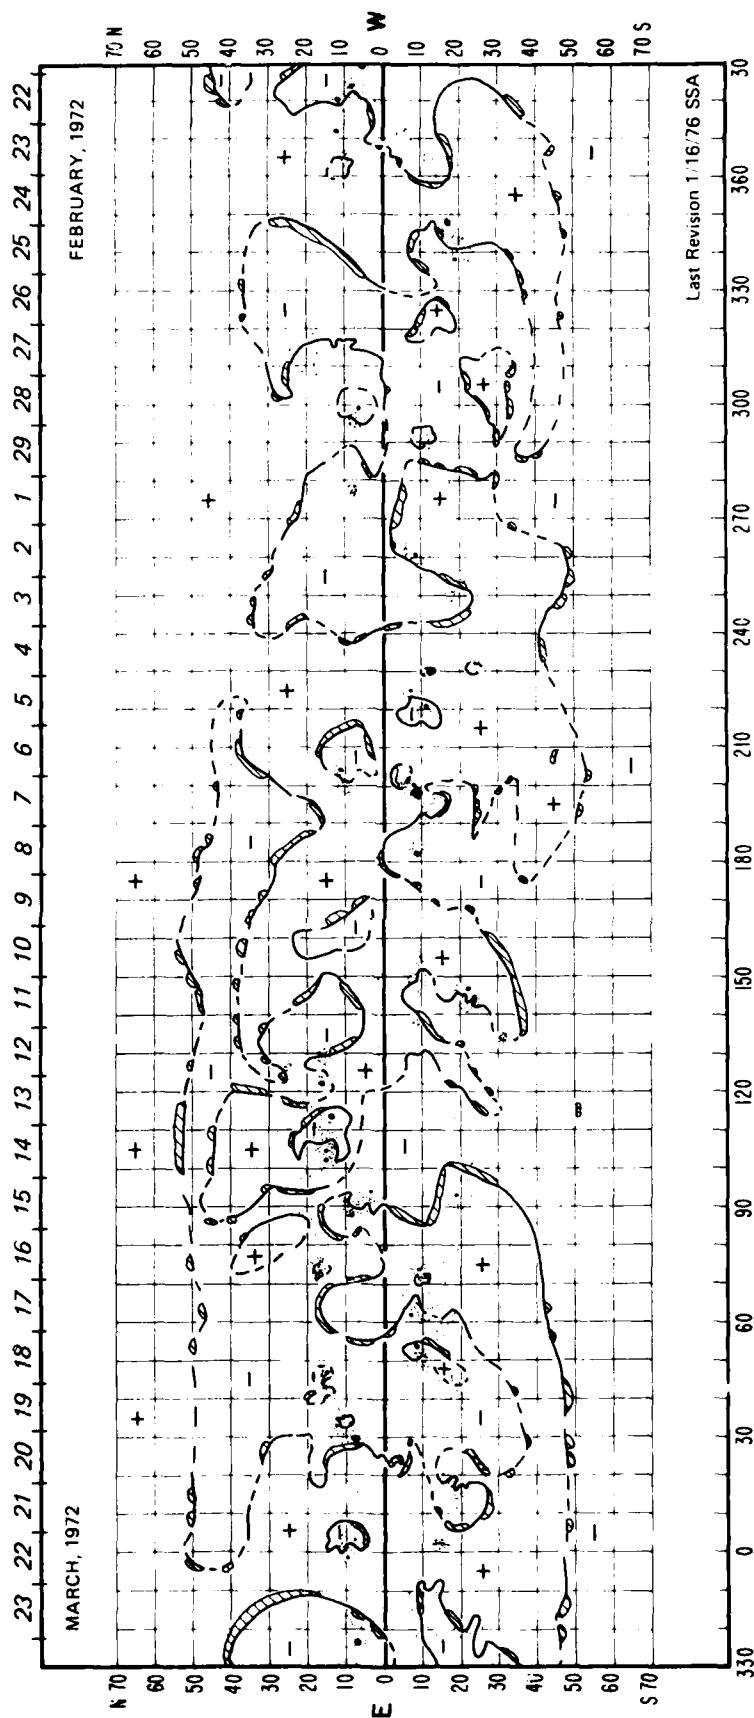

*Long.	*Lat.	Date	Descriptive Notes	*Long.	*Lat.	Date	Descriptive Notes
343	N15	2/25	CMP of large filament with inclination to equator of sign opposite to normal for large filaments in the Northern Hemisphere. Had formed northern portion of large-scale equatorial cell on previous 3 solar rotations. Cell merged with north polar region during this rotation; differential rotation then changed the neutral line's orientation. Six rotations later the great flaring region of August 1972 connected to this neutral line.	192	S10	3/7	Dark surges projected from follower spot; "islands" of follower-polarity plage north and south of the large leader spot reached maximum size. Filament disappeared.
342	S18	2/23	Peak development of large class E spot group with open interior. Leader spot divided after 24 February.	166	N09	3/7	Filament disappeared.
320	S14	2/21	Birth of small active region at west limb.	150	S33 N01	3/9 3/11	Large filament disappeared. Plage present this day only.
307	N25	3/3	Filament disappeared.	145	N08 S20	3/10 3/10	Filament present this day only. Birth of small region with small spots adjacent to north side of large single sunspot.
296	N08	2/26	Birth of active region that grew to maximum by 1 March as class D spot group.	138	S10	3/16	Birth of small active region.
290	S11	2/27	Birth of small active region.	137	S11	3/12 3/17	Filament disappeared; re-formed next day. Filament disappeared in apparent response to growth of nearby active region.
283	S15	2/28	Filament disappeared in apparent response to growth of nearby active region.	131	N10	3/9 3/12	Filament disappeared; re-formed 11 March. Filament disappeared again.
280	N10	2/25	Large filament disappeared near east limb.	125	N25	3/15	Birth of small active region.
277	N08	3/4	Birth of small active region.	122	N17	3/13	CMP of large, single sunspot that was surrounded by a counterclockwise vortical pattern of fibrils.
275	S04	3/1	CMP of filament which was active throughout disk transit.	120	N35	3/9	Filament disappeared; re-formed after 12 March and was very active.
261	N19	2/27	Birth of small active region.	117	N13	3/10	Filament disappeared from between closely-spaced active regions; re-formed after 12 March.
252	N21	2/28	Birth of small active region.	107	N14	3/9	Filament disappeared again. Maximum development of class E spot group with simple structure; interacted with older declining region west of this position.
244	S18	3/3	Large filament disappeared; re-formed 7 March near west limb.	100	S18	3/15	CMP of S-shape filament within extensive plage of reversed polarity (the return of the highly active region of the previous several solar rotations). Spot of leader polarity, but in following portion of the plage, disappeared by 19 March.
232	S23	3/2	Birth of small active region.	90	N08	3/11	Birth of active region that grew to follower-dominant class D spot group by 15 March; attained class E, as the leader became dominant by 17 March and rapidly diverged from the follower spots. Inclination of the group axis to solar equator was exceptionally large.
229	S12	3/3	Birth of small active region.	75	N18	3/11	Probable date of birth at east limb of small active region.
222	S09	2/28	Birth of active region at east limb that grew to maximum by 2 March as class C spot group with group axis inclined to solar equator at angle larger than normal.				
215	N10	3/7	Filament partially disappeared; re-formed next day.				
202	N11	3/2	Peak development of small class C spot group in bright plage that was larger than plages normally associated with so small a spot group.				
192	S10	3/3	Peak development of large, class F spot group with simple structure and exceptional length (exceeded 20 heliographic degrees).				

Note: There were no days without H-alpha photographs.

1972 - Rotation 1585 (Continued)

*Long.	*Lat.	Date	Descriptive Notes
73	S10	3/19	Birth of small active region on western edge of complex of three active regions.
70	N11	3/15	Small filaments disappeared.
65	N16	3/18	Filament disappeared.
62	S10	3/15	Birth of small active region near neutral line separating remnants of two extensive active regions. New region grew to maximum by 19 March and contained only a small spot group.
55	N06	3/16	Filament disappeared.
46	N15	3/23	Birth of small active region near west limb. Fourth in a series of small regions to form northwest of large, single sunspot.
42	Equator	3/22	Birth of tiny plage.
40	N15	3/23	Birth of small active region near west limb. Emerged between two small regions that lay northwest of a large, single sunspot.
32	N10	3/15	Birth of small active region with small spots close to northern edge of large, single sunspot. First of series of four small regions to form close to the sunspot.
		3/20	Important additional plage and larger spots formed on eastern edge of this region and even closer to the large spot. Second in a series of small regions that formed close to this spot.
23	S05 S23	3/18 3/18	Filament disappeared. Filament disappeared in apparent response to growth of nearby active region.
19	S18	3/17	Birth of active region with slow, complex growth until 23 March. Many highly variable spots formed, as if small amount of magnetic flux emerged on nearly every day of the disk passage.
15	S38	3/25	Filament disappeared.
12	S28	3/23	Filament disappeared.
2	S15	3/24	Birth of small active region.
1	N09	3/22	Birth of active region that grew to maximum by 24 March as class D spot group.

1972 - Rotation 1586

°Long.	°Lat.	Date	Descriptive Notes	°Long.	°Lat.	Date	Descriptive Notes
345	N30	3/23	Great filament disappeared in apparent response to growth of nearby active regions. Note change in orientation of neutral line north of N20 since previous rotation.	90	S15	4/7	Birth of active region in center of existing class D spot region that was near its peak development. New spots reached maximum on 9 April. Leader spots of the two overlapped groups approached one another, both disappearing soon after reaching minimum separation of less than 1 heliographic degree.
331	S22	3/25	Birth of new small region near neutral line within extensive faint plage.	85	S06	4/9	Maximum development of follower-dominant class D spot group that formed northern member of important activity complex.
330	N19	3/22 3/23	Maximum development of moderate-size class E spot group. Complex plage, absorption features and dark surges formed on western and southern border of large leader spot. Gone by end of next day.			4/15	Additional plage and small spots formed in leading portion of region after original spots had disappeared.
312	S12	3/22	Birth of small active region.	68	N36	4/15	Filament disappeared.
300	S04 N29	3/23 3/26	Birth of small active region. Filament disappeared.	60	S46	4/14	OMP of great polar-crown filament that became exceptionally large just before west limb passage.
275	S03	4/1	Large filament disappeared.	55	S22	4/19	Large filament disappeared at west limb.
250	S40	3/28	Filament disappeared.	54	S12	4/11	Maximum development of region with class C spot group. Plage remained bright and complex for most of disk passage.
245	S29	3/29	Birth of small active region.				
207	N02	4/1	Birth of small active region.	6	S07 N37	4/15 4/20	Birth of small active region. Filament disappeared.
192	S03	4/2	Curved filament within large active region disappeared. This region had formed on the sun's invisible hemisphere and in the northern portion of a large region from the previous disk passage.				
185	N35	4/4	Small filaments, bordering this large-scale cell of negative polarity, disappeared.				
184	S11	4/6	Birth of small active region within the scattered follower plage of large, old region. Slow growth still apparent at west limb passage.				
177	N03	4/10	Birth of small active region near west limb.				
167	N04	4/2	Filament disappeared.				
147	S11	4/6	Birth of small active region.				
145	N09	4/5	Birth of active region that grew to maximum next day with small follower-dominant spot group.				
121	N18	4/10	Filament disappeared within faint plage.				
95	S25	4/7 4/13	Great filament disappeared near east limb; re-formed next day. Filament disappeared again.				

Note: There were no days without H-alpha photographs.

1972 - ROTATION 1586

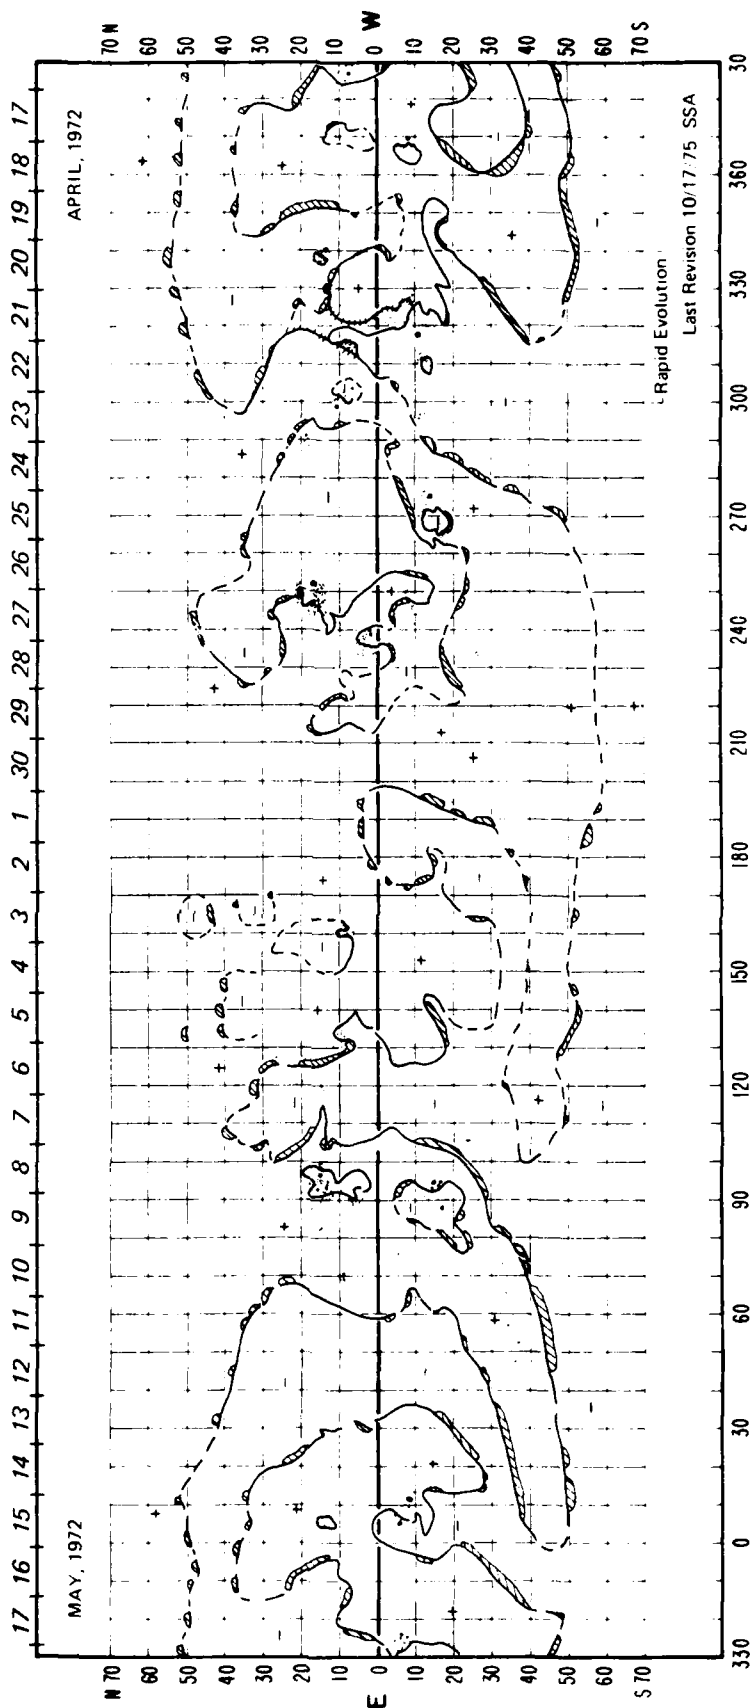

H $\alpha$  SYNOPTIC CHART  
1972 - Rotation 1587

*Long.	*Lat.	Date	Descriptive Notes	*Long.	*Lat.	Date	Descriptive Notes
338	M14	4/21	Birth of small active region.	103	N20	5/5	Filament formed.
325	S11	4/18	Maximum development of complex class E spot group that had formed in following portion of decaying, older region. Spot group was follower-dominant.	93	N05 S14	5/10 5/4 5/7	Filament disappeared in apparent response to growth of nearby active region. Birth of small active region. Maximum development of large and complex class D spot group that had formed shortly before east limb passage on 2 May.
320	S31	4/20	Birth of small active region.	92	N17	5/4	Birth of active region with slow initial growth.
316	N07	4/25	Birth of small active region.				Reached maximum on 10 May as class D spot group with relatively large inclination of group axis to solar equator.
312	S13	4/23	Birth of small active region in trailing portion of large follower-dominant region. New region expanded until its leader plage contacted the large follower spot of the old region.	83	N15	5/9	Birth of small active region.
308	N30	4/22	Filament disappeared, possibly as part of major rearrangement of neutral lines that in turn resulted from merger of large-scale areas of negative polarity.	80	S35	5/5	Large filament partially disappeared; re-formed after 6 May.
301	N09	4/24	Birth of active region that grew to maximum by 27 April as large class D spot group near west limb. Group axis was inclined to solar equator at exceptionally large angle. Large-scale neutral line 10° west of the region was oriented orthogonally to the spot group axis, as if this major magnetic boundary influenced the development of this important region.	76	S05	5/12	Birth of small active region.
297	S12	4/29	Birth of small plage at west limb.	70	N09	5/6	Birth of very small plage.
290	M18	4/19	Birth of small active region near east limb.	65	N29	5/11	Filament disappeared.
280	S25	4/23-26	Filaments along this large-scale neutral line disappeared gradually during these 4 days.	29	S20	5/11 5/14	Filament disappeared; re-formed 13 May. Filament disappeared again; re-formed by 17 May.
275	S06	4/22-23	Filament disappeared.	22	N20	5/16	Filament disappeared.
272	S14	4/19 4/21	Birth of small region at east limb. Birth of active region slightly east of small plage, which had nearly disappeared by this day. New region grew rapidly to maximum by 24 April as class C spot group.	20	S35	5/14	Large filament disappeared.
255	S23	4/23	Filament disappeared; re-formed after 26 April.	16	M12	5/10	Birth of small plage.
247	M24	4/28	Filament disappeared.	14	S49	5/13	Filament disappeared.
235	M02	4/23	Birth of small active region.	8	S07	5/16	Maximum development of complex class D spot group that had been active and highly variable since its east limb passage on 9 May. Exceptionally high spot count on some days. Group axis had negative inclination to solar equator, i.e., leader spot lay at higher latitude than followers.
222	M11	4/28-29	Filament disappeared.	5	N13	5/11	Birth of small active region.
185	S55	4/28	Filament disappeared.				
161	M09	5/4	Birth of small active region.				
131	M10	5/1	Birth of small active region near large filament that lay close to the east limb.				
126	S05	5/1	Birth of small active region near east limb.				
M13		5/2	Large filament disappeared in apparent response to growth of nearby active region.				
S05		5/6	Minor brightening of this region.				
122	M30	5/5-10	Filament exceptionally active.				
105	M10	5/2	Birth of small active region at east limb.				
S23		5/7	Birth of small active region.				

Note: There were no days without H $\alpha$ -alpha photographs.

# H $\alpha$ SYNOPTIC CHART

1972 - ROTATION 1587

H $\alpha$  SYNOPSIS CHART  
1972 - Rotation 1588

*Long.	*Lat.	Date	Descriptive Notes	*Long.	*Lat.	Date	Descriptive Notes
353	S29	5/13	Large filament disappeared near east limb.	105	N50	6/4	Almost all of large, active filament disappeared.
330	S04	5/15	Maximum development of class E spot group.	96	N06	6/2	Minor growth in small plage began and continued for next 4 days.
310	N24	5/17	Large filament disappeared.	95	N28	6/3	Large and very active filament disappeared, in apparent response to rearrangement of underlying neutral line. Re-formed after 8 June near west limb.
299	N13	5/14	Large single spot of follower polarity (positive) returned to east limb attended by bright leader-polarity plage without spots.	90	S16	6/4	Growth of plage and small spots near southern edge of large leader spot of simple class D spot group. This area became most complex on 8 June.
		5/17	New region with brilliant plage formed adjacent to northern edge of the large spot, growing to maximum by 19 May and creating a class D spot group of peculiar configuration.	77	S08	6/3	Birth of strong active region in the center of small plage. Grew rapidly to first maximum on 6 June as large class D spot group.
298	S13	5/18	Maximum development of class E spot group with large, symmetric leader and follower spots and simple configuration.			6/8	Rapid additional spot growth in the center of region created complex configuration and second maximum by 10 June near west limb. Region expanded westward into old plage of moderate intensity. Circular area of fibrils ahead of leader spot appeared to push plage into more compact form.
283	S21	5/23	Birth of small active region.	60	N09	6/5	Maximum development of small region with large class B spot group.
261	S15	5/21	Birth of small plage with single spot.	52	N20	6/7	Birth of small active region.
255	S24	5/25-26	Filament disappeared.	45	N07	6/5	Birth of small active region.
236	N19	5/29	Birth of small region near west limb.	38	S18	6/9	Filament disappeared; re-formed 11 June.
234	N11	5/31	Birth of small active region at west limb. Returned next solar rotation as remnant of an important region.	35	S31	6/7	Part of large filament disappeared.
192	S06	5/29	Birth of small active region.	27	N20	6/11	Large filament disappeared.
171	N23 S20	5/27 5/31	Small plage formed; gone by 29 May. Filament disappeared.				
163	N09	5/31	CHP of very active reversed-polarity region with complex class D spot group containing strong "delta" magnetic configuration in the leader spots. Maximum development approximately 29 May. Source of proton emission. Spot group axis at slight negative angle, i.e., leader spot at higher latitude than followers.				
155	S14	5/30	Birth of small active region.				
140	N31	6/1	Almost all of very active large filament disappeared.				
126	S04	5/31	Birth of active region that nearly disappeared next day; began strong growth on 2 June and attained maximum on 4 June as large class C spot group. Group axis strongly inclined at negative angle, i.e., leader spot at higher latitude than followers.				
120	S16	6/1	Birth of small active region.				

Note: There were no days without H-alpha photographs.

# H $\alpha$ SYNOPTIC CHART 1972 - ROTATION 1588

H $\alpha$  SYNOPTIC CHART  
1972 - Rotation 1589

°Long.	°Lat.	Date	Descriptive Notes	°Long.	°Lat.	Date	Descriptive Notes
355	N21	6/16	Large filament disappeared.	180	S30	6/25	Large filament disappeared.
	S27	6/18	Large filament disappeared at west limb.	169	N08	6/20	Embedded filament disappeared again.
339	S13	6/14	Birth of small active region on large-scale filament channel. Grew to maximum by 17 June with small class D spot group.			6/23	New spot growth in large, complex reversed-polarity region that had returned from previous disk passage. Filament, embedded in northern portion of the plage, disappeared; re-formed 29 June.
320	N17	6/12	Filament disappeared; re-formed next day.	154	N12	7/3	Birth of small active region at east limb and near trailing portion of large, reversed-polarity region.
	S30	6/13	Large, long filament disappeared; re-formed 15 June.			6/30	Birth of active filament that was especially large during latter portion of its disk passage.
	S49	6/17	Filament disappeared again.	112	S13		
	S05	6/18	Filament disappeared at west limb.	108	N08	7/3	Birth of small active region on southern border of large, active region.
310	S05	6/12	Great active filament north of major center of activity disappeared; partially re-formed next day and remained exceptionally active.				
304	S11	6/14	Maximum development of extremely complex class D spot group with many spots. Formed just west of returning follower spot of large region from previous solar rotation. Associated with a great active filament.	105	N16	6/28	Significant growth began in small active region. Maximum 1 July as class D spot group.
287	N10	6/14	Almost all of large filament disappeared near east limb. Remaining portion enlarged after 19 June.	99	N03	7/7	Birth of active region at west limb.
285	N10	6/20	Birth of small active region.	96	N05	6/28	Birth of small active region near eastern border of large active region.
275	S01	6/15	Small filament disappeared in apparent response to growth of nearby active region.	95	S03	7/4	Birth of small active region.
266	S05	6/14	Probable date of birth of small active region near east limb.	86	S12	7/4-5	Clockwise vortical pattern to fibrils surrounding large, single spot.
		6/19	Additional region growth.	62	N05	7/4	Filament disappeared.
261	N12	6/23	Birth of small active region.	40	S26	7/11	Large filament disappeared at west limb.
245	S24	6/16	Birth of small active region.	28	N10	7/8	Large, very active filament formed semicircle along western boundary of vortical field of fibrils emanating from great active region.
	N15	6/22	Birth of small active region on neutral line north of large stable spot.	20	S03	7/4	Birth of active region that grew to maximum by 6 July with class C spot group.
242	N09	6/21	CMP of large single spot remarkable for associated neutral line oriented northwest-southeast, i.e., opposite to normal for Northern Hemisphere. Inclination angle of group axis significant when region lay near east limb as a class C spot group. Group axis orientation was consistent with northwest-southwest alignment of associated neutral line.			7/11	Additional growth near west limb.
235	N30	6/17	Filament disappeared at east limb.	16	N10	7/3	Birth of active region within northern portion of active region near east limb. Older feature had crossed east limb with a large, single leader spot.
228	S08	6/18	Maximum development of class F spot group with large leader spot and large number of small follower spots. Neutral line doubled back through the region, indicating that the region was composed of two merged bipolar groups.				Growth of new plage and spots produced complex region with extensive vortical fibril field and clockwise sense of twist. Although such vortical patterns are usually confined to the vicinity of a large leader spot, here they encompassed the entire active region. This was the most active region for this solar rotation. Maximum development occurred by 6 July. New spots remained small but numerous.
215	S11	6/20	Birth of active region at western end of filament and near eastern edge of large class F spot group region. Grew to maximum next day as class C spot group. Second maximum in area reached 24-25 June as small class D spot group.	11	N01	7/9	Active filament formed along neutral line that extended south of the large active region.
	Equator	6/20	Filament disappeared near east limb; re-formed 25 June.	9	N13	7/11	Birth of active region near west limb that grew to peculiar class C group by 13 July. Group axis 90° from normal orientation with leader spot directly south of followers. Main spot returned next rotation as a member of the most active spot group of Solar Cycle 20.
190	N16	6/29	Filament disappeared near west limb.	N30		7/12	Filament disappeared.

Note: Day without H-alpha photographs was 2 July 1972.

# H $\alpha$ SYNOPTIC CHART 1972 - ROTATION 1589

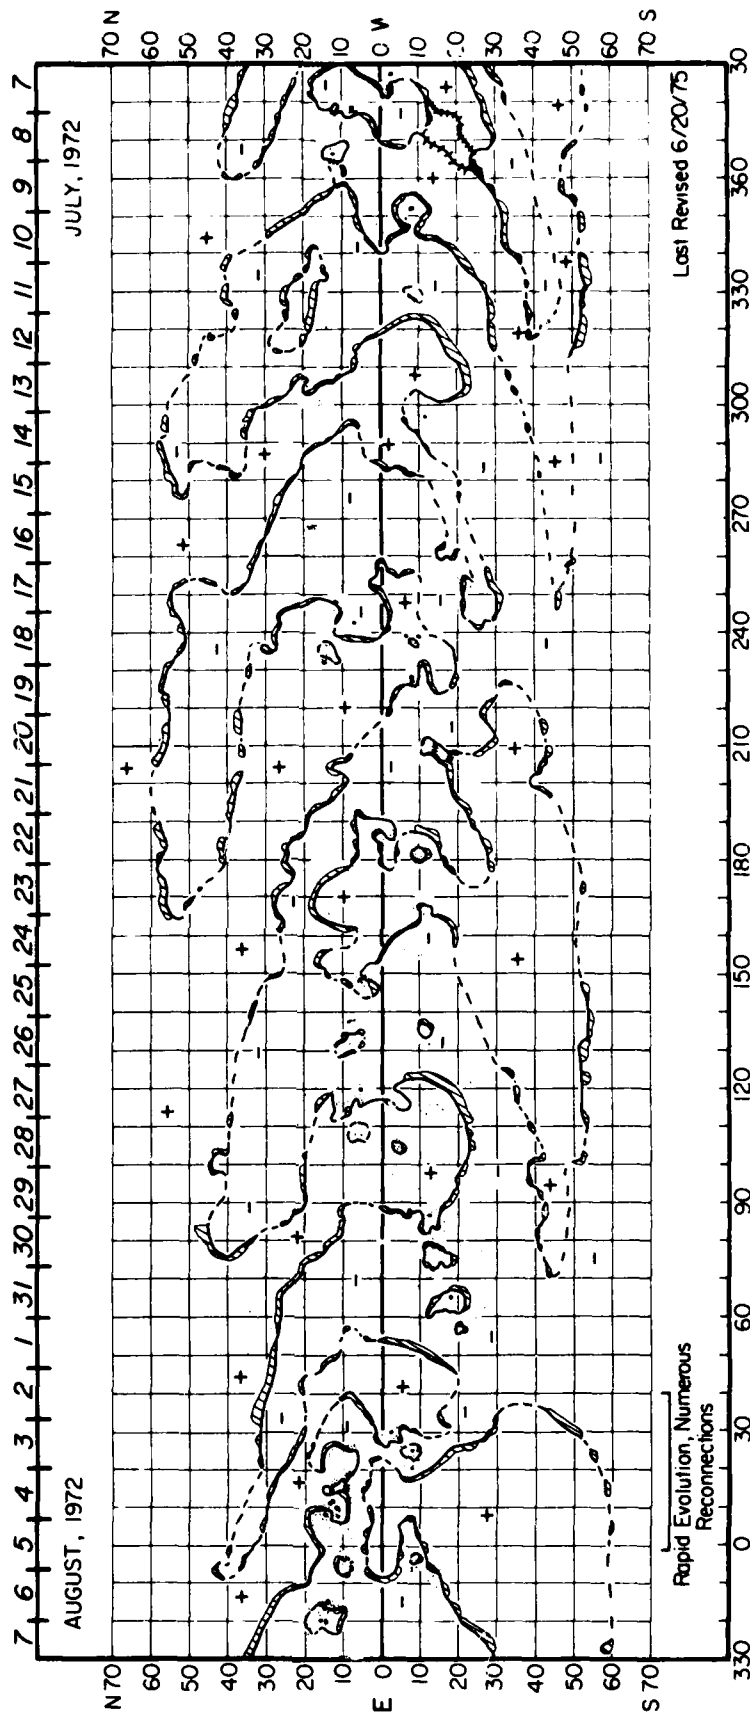

H $\alpha$  SYNOPTIC CHART  
1972 - Rotation 1590

*Long.	*Lat.	Date	Descriptive Notes	*Long.	*Lat.	Date	Descriptive Notes
352	S08	7/6-10	Neutral line encircling follower sunspots remained connected to adjacent neutral line east of region through 6 July. Closed neutral line loop formed isolated negative cell 7-10 July, then rejoined adjacent neutral line in original configuration.	64	S17	7/27	Region born near east limb became small D-type group.
330	S08	7/13	Birth of small active region that remained visible 2 days only.	30	S05	7/28 7/30	Small plage at east limb; gone by next day. Stronger region formed in plage area; reached maximum as a D-type spot group by 3 August.
325	N18	7/14	Filament disappeared.		S50	7/31	Filament near east limb disappeared.
300	N17	7/19	Region born near west limb.	40	N30	7/31	Filament disappeared; gradually re-formed by 6 August.
290	N15	7/10	Large filament disappeared near east limb.	25	N23 S08	7/31 8/3	Almost all of filament disappeared. Birth of active region that formed adjacent to above filament.
268	N19	7/16	Tiny bipolar region visible 1 day only.	18-32	S05-S30	7/31	Filaments along this continuous neutral line disappeared.
258	S25	7/14 7/17	Small plage formed without spots. Region with spots stronger than those on 14 July emerged. Group nearly disappeared by 21 July when small additional plage formed in western portion.			8/3	Development of large single filament.
243	S10	7/14-22	Plage and absorption-feature activity south of sunspot maximized 14 July and vanished by 18 July. Vigorous new region emerged at this location 22 July, enveloping the old sunspot.	10	N12	8/4	This large circular sunspot group marked the site of the most energetic flares of Solar Cycle 20: those of 4, 6 and 7 August. Spots exhibited large relative proper motions in a vortical pattern.
238	N03	7/22	North-south filament disappeared.				
235	N12	7/18	Strong region with D-type spot group formed late in the day; expansion of region affected filament and major neutral line west of region.				
227	S08	7/21	Large sunspot invisible in H-alpha.				
212	S10	7/16 7/21	Small region born. Expansion of leader polarity effected disruption of filament/neutral line to south, with rearrangement of neutral line by 21 July.				
195	N15	7/25	Most of filament disappeared.				
183	S08	7/25	Small region formed.				
170-240	N55	7/22	Much of polar crown filament disappeared.				
135	N07	7/25	Birth of active region that grew to large D-type spot group by 29 July.				
120	S08	CMP 7/28	Filament exceptionally large after central meridian passage.				
107	N06	7/30	Small region born 30 July; gone by 2 August.				
105	S04	7/25	Birth of small region that disappeared by 30 July.				

Note: There were no days without H-alpha photographs.

# H $\alpha$ SYNOPTIC CHART 1972 - ROTATION 1590

H $\alpha$  SYNOPTIC CHART  
1972 - Rotation 1591

*Long.	*Lat.	Date	Descriptive Notes	*Long.	*Lat.	Date	Descriptive Notes
355	N07	8/8	Small region born.	85	S08	8/28	Birth of active region; rapid growth to moderate type D spot group by early on 30 August.
352	Equator	8/5	Filament disappeared.	78	S25	8/22	Filament disappeared with resultant parallel-ribbon flare at 1340 UT on 22 August. New filament formed 23 August and moved systematically poleward and westward through the remainder of the disk passage, becoming increasingly separated from its neutral line at the surface. The filament encountered west limb 2 days before west limb passage of its associated surface neutral line.
344	N14	8/9	Birth of region.	75	N17	8/26	Birth of active region with peak development 28 August; rapid decline on 29 August.
338	S22	8/4	Filament disappeared. Partially re-formed by 9 August.	40	S15	8/29	Two small regions formed simultaneously in contact with each other. They dissipated by 2 September.
330	N35	8/7	Filament enlarged.	35	S06	8/28	Additional plage formed, surrounding existing leader sunspot.
330	N35	8/11	Filament disappeared.	34	S02	8/27	Filament disappeared.
310	N08	8/13	Tiny region visible 1 day only.	30	N05	8/28	Filament disappeared.
308	N18	8/6	Filament disappeared.	27	S07	9/1	Birth of active region with rapid growth 2-3 September. Forced complex rearrangement of surrounding neutral lines.
303	S18	8/12	Birth of small active region that declined by 13 August.	7	N15	8/29	Region emerged through old "follower" plage (of "leader" polarity) that represented remnants of powerful active region of previous rotation. Growth peaked by 31 August.
250	N20	8/18	Minor growth in small region.				
240	N17	8/11	Birth of active region with slow initial development and transient filaments.				
		8/17	Rapid growth occurred.				
230	N11	8/12	Birth of small active region.				
210	N16	8/12	Probable date of birth of region at east limb.				
178	N26	8/14	Birth of active region near east limb, which reached maximum as a class C spot group.				
173	N26	8/21	Small plage visible 1 day only.				
165	S26	8/16	Maximum development of class C spot group near east limb.				
160	S40	CMP 8/20	Fission of large-scale, positive-polarity area occurred during disk passage.				
155	N16	8/25	Small region formed near west limb.				
150	N17	8/20	Birth of tiny active region.				
130	N20	8/29	Small bright plage formed at west limb.				
113	N09	8/19	Region formed as a brightening of scattered plage near east limb on an existing large-scale neutral line. Peak development occurred 22 August.				
112	S25	8/26	Birth of small region under large quiescent filament.				
			Nearly dissipated by 29 August at west limb.				
110	S05	8/19	Birth of region near east limb; growth until 22 August.				

Note: Day without H-alpha photographs was 8 August 1972.

# H<sub>q</sub> SYNOPTIC CHART 1972 - ROTATION 1591

H $\alpha$  SYNOPTIC CHART  
1972 - Rotation 1592

*Long.	*Lat	Date	Descriptive Notes	*Long.	*Lat.	Date	Descriptive Notes
328	N14	9/9	Significant brightening of small active region just before west limb passage. Region had been evolving in rapid and complex manner during previous 6 days.	153	N06	9/14	Birth of small region, with maximum development by 15 September. Unusual active filament formed southeast of region 20 September as secondary growth of plage occurred.
315	S08	9/1	Birth of small region with peak development 3 September as class C spot group.	134	N13	9/14	Birth of small region, with maximum development by 15 September. Exceptionally rapid dissipation 18 September. Complex and active filament channel and terminus of active transequatorial filament lay 10° south of this region.
		9/5	Stronger region than that of 1 September emerged in same location and reached peak development 7 September as class E spot group. Expansion of region resulted in filament disappearance south of region 8 September.	132	S10	CMP 9/19	Filament exceptionally large and active during entire disk transit.
308	N05	9/5	Birth of small active region that dissipated rapidly after 8 September as another region formed to the northeast.	124	N07	9/20	Small filament disappeared.
305	N08	9/7	Birth of active region. Growth coincided with filament disappearance south of region 8 September.	115	S12	9/15	Birth of small region with maximum development 16-17 September.
299	S08	9/5	Birth of small active region that showed additional growth on 7 September.			9/20	Major new growth with filament development. Dissipation began 24 September.
290	N15	9/8	Filament disappeared as region grew southwest of this location.	103	S15	9/23	Tiny new region present 1 day only.
258	N18	9/5	Birth of small region.	92	N25	9/24-26	Large curved filament formed as new region developed at (83,N17).
257	S06	9/6	Birth of small active region.	83	N17	9/25	Birth of small region with maximum development just before west limb passage 27-28 September.
244	N15	9/8	Filament within old plage region disappeared as new region developed to the northeast.	75	S15	9/19	Filament embedded in plage near leader sunspot disappeared while accompanied by chromospheric brightenings. Filament re-formed 20 September, disappeared 22 September, and re-formed 23 September, disappeared 24 September, and re-formed 25 September. Associated leader sunspot divided 23 September as new plage grew north of spot. Positive-polarity cell, bounded intermittently by filaments, divided 26 September. This cell merged with large positive cell to the west by west limb passage 28 September.
238	N20	9/7	Birth of strong active region that formed large leader sunspot by 9 September. Vortical structure north of leader formed 12 September. Polarity arrangement reversed from normal for Northern Hemisphere in even numbered solar cycle.	37	S05	9/21-22	Large active region composed of two regions that merged 21-22 September. Eastern component younger than western component. Groups formed just before east limb passage on 20 September. Gradual decay of region after 25 September and rapid decay 28 September.
226	S10	9/12	Birth of small active region.				
180	N18	9/16	Large curved filament disappeared.				
170	N18	9/18	Birth of active region near site of large disappearing filament 16-17 September. Nearly dissipated by 20 September.	8	N08	CMP 9/28	Compact plage with strong follower sunspot near east limb; continual and gradual dissipation throughout disk transit.
165	S20	9/18	Filament, which had been large and active throughout disk transit, disappeared.	0	S15	10/2	Large filament disappeared near west limb.
162	S08	9/18	Merging of leader-polarity fields with large positive-polarity region to west occurred after this date.				

Note: Days without H-alpha photographs were 16 and 29 September 1972.

H $\alpha$  SYNOPTIC CHART  
1972 - Rotation 1593

"Long.	"Lat.	Date	Descriptive Notes	"Long.	"Lat.	Date	Descriptive Notes
348	S05	10/3	Filament vanished 1 day after large filament disappearance at (0.515).	68	N42	10/17 10/21	Filament disappeared. Filament re-formed.
338	S08	9/25	Region formed at east limb and slowly developed to maximum size by 1 October. Minor additional growth on 3 October.	65	S05	10/19	Significant growth of small active region. Spots and plage reached maximum development 21 October.
320	N20	10/2	Filament activity on northern border of cell was followed by decrease in size of the cell.	44	S05	10/21	Minor plage growth.
310	N11	9/29	Birth of strong active region. Developed large leader and follower spots and reached maximum area by 1 October. Gradual decay from 2 October to west limb passage. Filament formed within region and disappeared next day.	25	S15	10/19	Birth of small active region that reached maximum as class C spot group 21 October.
308	S12	10/3 10/7	Birth of small region with decay occurring 4-6 October. New growth commenced and continued through west limb passage 9 October.				
280	N17	10/4	Birth of small region; declined after 6 October.				
270	S05 S20	10/5 10/7-11	Birth of small region; dissipated by 8 October. Exceptionally large filament.				
255	S10	10/9	Plage growth in old active region with rapid decline after 10 October.				
250	S12	10/11	Birth of region in following portion of old plage. Growth in progress at west limb 13 October.				
240	N01	10/7	Birth of tiny region that vanished by 10 October.				
215	S10	10/11	Filament disappeared.				
207	S05	CMP 10/10	Filament steadily enlarged throughout disk transit.				
192	N20	10/15	Birth of new region, which grew rapidly until west limb passage 17 October.				
183	N03	10/11	Birth of small region which dissipated by 14 October.				
173	N22	10/14	Birth of small region in which growth ceased on 16 October.				
170	S05	10/16	Filament disappeared near same latitude of disappearance on previous day of very large eruptive filament east of this location.				
136	S15	10/15	Large active filament disappeared.				
105	N32	10/16 10/23	Filament became exceptionally active. Filament disappeared.				

Days without H-alpha photographs were 29 September and 18 October 1972.

1972 - ROTATION 1593

# H $\alpha$ SYNOPTIC CHART 1972 - Rotation 1594

°Long.	°Lat.	Date	Descriptive Notes	°Long.	°Lat.	Date	Descriptive Notes
360	S31	CMP 10/26	Filament was exceptionally large and stable for the entire disk transit.	51	N20	11/19	Tiny plage clearly visible 1 day only.
335	N20	11/1	Large filament disappeared.	33	N30	11/17	Filament disappeared.
312	S10	10/30	Peak development of a great active center with sunspot group exceeding 1500 millionths of the solar hemisphere in area. Complex active absorption features formed frequently west and north of the giant leader spot.	25	N15	11/16	Filament disappeared and gradually re-formed by 19 November.
308	N07	10/28 11/4	Birth of small region which declined after 28 October. New region born near position of previous region.	7	S08	11/20	New region developed rapidly but quickly dissipated next day.
305	S32	10/30	Filament disappeared.			11/22	New and even stronger development that attained a Class D sunspot group by 25 November. Filaments north and west of the region were active and disappeared 23 November.
288	S04	11/4	Birth of large active region that grew rapidly to at least a class D spot group by west limb passage 6 November.	S18		11/23	Small region formed; disappeared by 26 November.
285	S12	11/3	Small plage formed at terminus of filament.				
282	S37	11/2	Filament disappeared on same neutral line as filament disappearance of 30 October. Re-formed 4 November.				
279	S11	10/29	Birth of small region.				
254	N14	10/30	Birth of small region.				
247	S13	11/3	Birth of tiny region, which was associated with filament disappearance of 5 November.				
		11/8	Second and more important growth near west limb.				
225	S10	10/31	Birth of small plage.				
210	N20	11/11	Birth of region within faint extended plage. Still growing at west limb next day.				
205	S18	11/5	Filament disappeared; re-formed gradually during remainder of disk passage.				
202	N05	11/9	Birth of region which grew to class D spot group by 12 November.				
140	S22	11/15	Merger of two large positive cells.				
125	S25	11/12	Large filament disappeared.				
105	S05	11/15	Partial disappearance of large filament.				
75	N14	11/13	Birth of small active region.				
53	N07	11/16	Birth of small active region.				

Note: There were no days without H-alpha photographs.

# H $\alpha$ SYNOPTIC CHART

1972 - ROTATION 1594

H $\alpha$  SYNOPTIC CHART  
1972 - Rotation 1595

*Long.	*Lat.	Date	Descriptive Notes
337	N15	11/24	Birth of small region.
323	S11	11/23	Plage with small circular neutral line emerged south of large sunspot, becoming very weak by 29 November.
284	S17	11/27 11/30	Birth of small region. Second and more important growth to class D spot group.
240	S16	12/3	Filament disappeared.
211	N12	12/4	Filament disappeared.
210	S14	12/2	Birth of small region that reached maximum 5 December as class C spot group with polarities reversed from normal arrangement for Southern Hemisphere.
162	S05	12/9	Birth of small region.
110	N10	12/6 12/9	Birth of strong region on following boundary of old plage at east limb. Large, complex region formed from collision and merger of these two regions. Region maximized as class D spot group.
105	S06	12/11	Large filament disappeared concurrent with new regions forming near its southern terminus.
95	S17	12/9	Birth of small region that merged with the negative cell to the north by 15 December.
60	N20 S20	12/11 12/11	Birth of small region. Birth of large active region that grew to class E spot group by 13 December.
8	N20	12/17	Birth of small region that disappeared by 22 December.

Note: There were no days without H-alpha photographs.

1972-1973 - Rotation 1596

*Long.	*Lat.	Date	Descriptive Notes
360	N03	12/20	Filament active throughout disk passage.
353	S10	12/15	Birth of small active region.
350	N52	12/20	Filament active throughout disk passage.
345	N18	12/16 12/17 12/20	Region formed as small brightening beneath filament. Filament disappeared. Maximum development of D type spot group.
329	S16	12/26	Small plage formed on west limb.
318	N29	12/23-24	Filament disappeared.
314	N18	12/20 12/25	Birth of small region. Significant brightening; region merged with larger region to the south.
313	S10	12/15	Birth of small active region.
310	N12	12/20 12/25	Birth of active region. Region at peak activity as class C spot group.
264	S18	12/29	Small region appeared in position of old faint plage.
217	N22	12/27 12/31	Filament disappeared; gradually re-formed during next 3 days. Filament disappeared.
200	N15	1/2	Birth of small region.
175	S18	1/1	Birth of small region.
173	S13	1/6	Birth of small region in old plage area.
148	N10	12/31	Filament west of large active region near east limb disappeared.
146	S23	1/5	Filament formed; disappeared 6 January.
140	N09	12/30	Probable birth of region on east limb. Region at maximum activity as class C spot group on 6 January.
135	S34	1/1	Filament spread and dissipated; re-formed 8 January and grew large again.
115	N14	1/6	Maximum activity as type E spot group.
110	S09	1/8	Filament disappeared.
18	S18	1/9	Birth of small region near east limb.

Note: Days without H-alpha photographs were 19 December 1972 and 3 January 1973.

H $\alpha$  SYNOPTIC CHART  
1973 - Rotation 1597

*Long.	*Lat.	Date	Descriptive Notes	*Long.	*Lat.	Date	Descriptive Notes
355	Equator	1/20	Filament disappeared.	87	Equator	2/1	Appearance near east limb of short-lived plage; gone by 4 February.
327	S12	1/17	Birth of active region that attained moderate-sized type D spot group by 21 January. Cell of negative polarity immediately west of region was bounded by active filaments 3 days before region formation.	77	S05	2/1	Birth of active region near east limb. Maximum spot development 3 February as class C spot group. Filaments developed within and east of region 8 February.
321	N03	1/18	Birth of small region, which grew only 1 day, then decayed through remainder of disk passage.	40	S12	2/10	Filament disappeared simultaneously with formation of filament at S02 on same neutral line.
316	N12	OMP 1/20	Large sunspot returned from previous rotation with almost all of plage in follower polarity along a curve concentric to the sunspot. Little changed until central meridian passage, when weak new plage formed east and southwest of spot on 20 January. Southwest portion brightest on 23 January.	31	N12	2/7	Birth of small region that reached maximum development 10 February.
315	S25	1/17	Large filament disappeared in apparent response to new region (327, S12) emerging at low latitude end of filament.			2/11-12 2/13	Additional region growth occurred. Additional flux region appeared directly north, presenting a complex bright region on 14 February as the area approached west limb.
295	S15	OMP 1/21	Exceptionally large and active filament.	18	S08	2/17	Small bright plage born near west limb (not on chart).
290	N25	1/24	Filament disappeared.	14	N10	OMP 2/12	Large region consisted of a pair of regions aligned north-south on a common neutral line with large leader spots in both regions. Growth occurred in smaller, southern (N08) member 12-13 February. Northern member declined slowly throughout disk passage.
283	N18	1/20	Birth of small active region.				
260	S15	1/22	Faint region formed in old plage.				
248	M14	1/26	Small curved filament disappeared.				
246	N10	1/20-22	Small region born near east limb; began decay 21 January. Second region formed at east end of first region and the two merged into a common neutral line by 25 January. The older western member was gone by 24 January.				
240	M19	1/24	Birth of small region.				
210	S10	1/23	Birth of small region near east limb.				
		1/29	Minor new growth.				
	M10	2/1	Filament grew larger 28-31 January and disappeared 1 February.				
183	S16	2/3	Small region born near west limb.				
165	N28	2/1	Large filament gradually fragmented after 1 February as reconfiguration process may have begun. Note change in this pattern on rotation 1598.				
146	N20	2/6	Large filament disappeared near west limb. This occurrence may be part of process of large-scale reconfiguration along the neighboring neutral line that is evident on rotation 1598 and later.				
138	S02	2/5	Birth of small region.				

Note: There were no days without H $\alpha$ -alpha photographs.

# H<sub>α</sub> SYNOPTIC CHART

1973 - ROTATION 1597

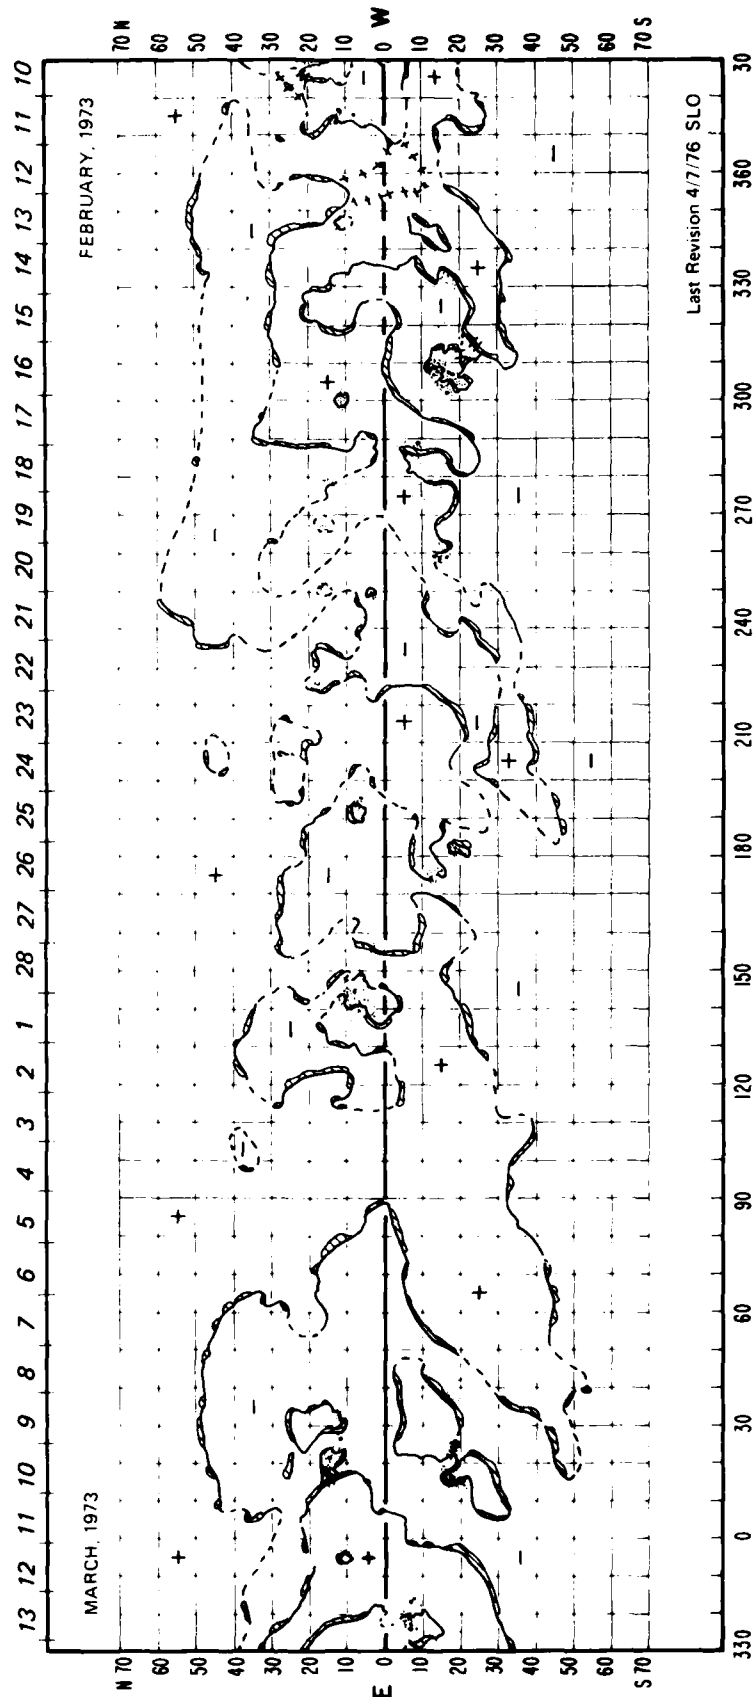

Last Revision 3/30/76 SLO

H $\alpha$  SYNOPSIS CHART  
1973 - Rotation 1598

*Long.	*Lat.	Date	Descriptive Notes	*Long.	*Lat.	Date	Descriptive Notes
355	S18	2/8	Filament near east limb partially disappeared. Two filament fragments disappeared. Crossed out neutral line here and to northwest probably disappeared at this time as magnetic patterns re-formed.	223	N18	2/16	Birth of small region near east limb. Slow growth through 19 February. Filament formed within the decaying plage 22 February.
347	S13	2/10	Filament embedded in faint plage became elevated from neutral line.	222	S15	CMP 2/23	Large filament elevated and active throughout disk passage.
345	N10	2/12	Birth of small region, which remained at constant intensity and small size for nearly all its disk passage. Filament disappeared near west limb. First became conspicuous 12 February.	193	N06	2/24	Birth of small active region that developed slowly through 1 March.
320	S22	2/14-16	Large filament disappeared except for small fragment that moved slowly southward until 18 February. Western portion of filament, which was part of neutral line within an active region, enlarged and darkened after 15 February.	182	S20	2/19	Probable date of birth of small active region at east limb. Developed circular embedded filament 22 February. Nearly invisible by west limb passage 4 March.
	N17	2/19	Filament disappeared. Enlarged significantly 12 February. Evolution appeared to parallel filament at (345, N25).	177	N23	2/22	Part of filament near east limb disappeared.
317	S32	2/19	Small filament disappeared.	174	S14	2/20	Probable date of birth of small active region at east limb.
310	S01	CMP 2/12	Large east-west filament was exceptionally active and elevated throughout disk passage.	165	N27	2/28	Rapid growth to class 0 spot group. Decayed at west limb 4 March.
305	S16	CMP 2/16	Moderate-sized active region was growing at east limb transit 10 February. Several bipolar area emerged a few degrees east of neutral line 16 February. A third region emerged north of this complex 18 February. Entire region was fading at time of west limb passage 22 February.	160	S09	2/27	Filament disappeared.
				156	S05	3/3	Filament disappeared.
303	N11	2/16	Birth of tiny region. Rapidly dissipated 18 February.	140	N07	2/25	Large filament formed.
287	S09	2/22	Filament formed in decaying active center 16 February and became elevated 21 February before erupting with consequent flare 22 February. Filament activity appeared related to other active filaments along the same highly convoluted neutral line.			2/28	Peak development of large active region that formed at location of great region of rotation 1596. New plage with flares formed on west boundary of the large leader sunspot. This activity had faded by 4 March.
278	S15	2/15-23	Filament formed 15 February and developed progressively along curved neutral line south and east. Disappeared 21 February in apparent response to developing active region to the east. Re-formed 23 February, just before west limb passage.	138	S22	2/27	Filament disappeared and re-formed next day.
						3/1	Filament disappeared and re-formed again.
274	S10	2/17	Birth of very small region.	122	N22	2/27	Filament disappeared. Re-formed 28 February and enlarged steadily until west limb passage 8 March.
				118	S05	2/26	Filament visible this day only.
				100	S35	3/7	Filament disappeared but re-formed next day.
				76	N15	3/4	Most of filament disappeared.
				75	S05	3/8	Filament became oriented more east-west and became active from this day until limb passage 13 March. These developments occurred as distance to a neutral line to the east decreased noticeably. The two neutral lines combined by the next rotation.
							Faded as it evolved into a cellular form.
260	S15	2/18	Birth of small active region that reached peak development 20 February. Minor growth 24 February.	60	N17	3/5	Small region, which was bright on 1 March at east limb, faded as it evolved into a cellular form.
251	N16	2/20	Birth of small active region. Faint and fading throughout disk passage.	24	N14	3/6	Birth of region within extensive area of faint plage. Became large type C sunspot group by 8 March.
249	N03	2/22	Birth of tiny active region.	20	S18	3/9	Merger of two large-scale areas of positive polarity as a result of expanding active region fields.
235	N45	2/20	Filament disappeared.	15	S18	3/5	New plage with spots formed north of older region. Filament disappeared as active region to west expanded to cause rearrangement of neighboring neutral lines. Large section of filament remained visible 10-13 March, 10° north of this location and apparently suspended far above the neutral line.
234	N14	2/20	Filament disappeared.				

Note: There were no days without H-alpha photographs.

# H<sub>α</sub> SYNOPTIC CHART 1973 -- ROTATION 1598

# H $\alpha$ SYNOPTIC CHART 1973 - Rotation 1599

*Long.	*Lat.	Date	Descriptive Notes	*Long.	*Lat.	Date	Descriptive Notes
340	S05	3/8	Probable date of birth of active region at east limb. Grew rapidly to maximum on 11 March as class E spot group.	43	N12	3/31	in the series of shaded charts at the end of this atlas.
328	S12	3/10	Birth of important active region on western border of old plage that contained a large, single leader sunspot. Grew to maximum by 14 March as class D spot group with old leader spot appearing as the "follower" of the group.			4/1	Growth began within old, small plage and spot group near east limb.
308	N06	3/11	Birth of small active region.			4/8	Maximum development as a class D spot group with high magnetic gradient and spots in abnormal north-south configuration.
230	S20	3/22 2/24	Filament partially disappeared; re-formed 23 March. Filament disappeared.	25	S13	4/1	Filament disappeared within this region.
223	N15	3/15 3/23	Probable birth of active region on east limb. Region showed slow development to class C maximum. Bright compact plage featured throughout disk passage.				Birth of small region.
220	S15	3/22	Birth of tiny plage, possibly associated with disappearing filament. Plage disappeared following day.				
206	S22	3/25	Filament disappeared.				
194	N10	3/22	Birth of small region which disappeared 25 March.				
144	N08	3/28	Central meridian passage of large complex region on second disk passage.				
140	N10	3/30	Rapidly developing region appeared at approximately 2200 UT. Region became quite large and bright within hours of birth and began to merge with large region to the west before completing disk passage.				
		4/1	Reached maximum as D-type spot group.				
120	N25	3/27	Large filament disappeared.				
110	S10	3/28	Birth of small region.				
78	S06	3/29 4/2	First maximum of class E spot group. Important new growth of spots and plage on northern border of large class E spot group. Maximum development by 4 April of blend of these two bipolar areas. This region developed in the same heliographic location as important region of rotation 1597.				
60	N10	CMP 4/3	Large-scale cell of negative polarity extended 40° in latitude and over 60° in longitude. This feature separated from patterns to its east on this solar rotation and remained a distinctive, large, isolated cell near the solar equator for the remainder of 1973. By rotation 1603 it had evolved into the form of a "fish". This evolution is seen clearly				

Note: Days without H-alpha photographs were 2 and 6-7 April 1973.

# H $\alpha$ SYNOPTIC CHART 1973 - ROTATION 1599

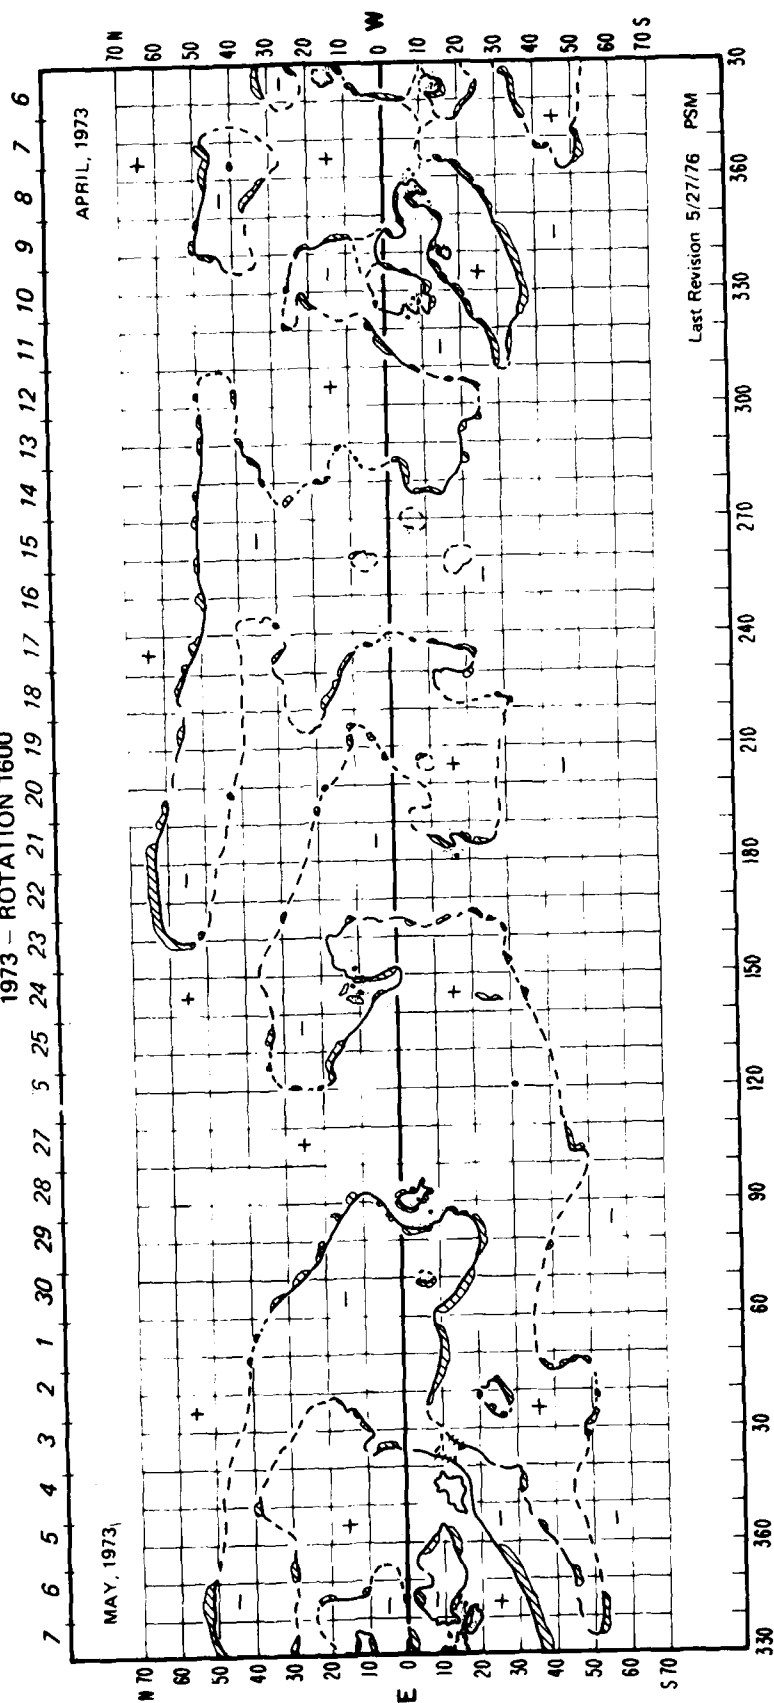

# H $\alpha$ SYNOPTIC CHART 1973 - Rotation 1600

"Long.	"Lat.	Date	Descriptive Notes	"Long.	"Lat.	Date	Descriptive Notes
337	S09	4/9	Minor growth within extensive remnants of significant region that had returned from previous disk passage.	65	S15	4/25	Filament rotated onto disk as very large and dark feature.
340	S38	4/11	Filament became very large and dark and remained so until completion of disk passage.	15	S12	5/4	Birth of small region.
335	S05	4/9	Large filament, which delineated neutral line between two large active regions, disappeared.				
325	S05	4/6	Birth of large active region that grew rapidly to an E-type spot group by 9 April.				
		4/9-12	Region's plage combined with that from region to the west, forming a large bright plage complex.				
		4/12	Plage brightened and region separated from western region.				
315	Equator	4/9	Filament disappeared.				
283	S03	4/16	Filament disappeared.				
278	S05	4/16	Filament disappeared.				
270	S05	4/12	Birth of small region.				
260	S19	4/13	Birth of small region.				
259	N05	4/14	Birth of small region.				
185	S15	4/17	Birth of active region, that reached maximum as a small D-type spot group on 22 April.				
150	N05	4/21	Large filament disappeared that was associated with complex active region. Reappeared following day as long, thin, dark filament.				
	N10	4/23	Maximum development of class E spot group with polarities reversed from normal arrangement for Northern Hemisphere. Region appeared to evolve as two overlapped bipolar spot groups. It contained a "delta" configuration and produced a large proton flare.				
		4/26	Second major growth phase began and reached maximum 29 April as compact, round penumbra of 1000 miles in diameter with strong "delta" configuration.				
88	N03	4/27	Filament disappeared.				
	S05	Chp 4/29	Second disk transit of region in area that had been active since rotation 1597; it continued to be active until rotation 1603. This region formed the leading boundary of the large-scale, negative-polarity cell called "the fish".				
	S03	4/30	Top of horseshoe formation of filament disappeared.				
83	S03	4/27	Filament disappeared.				

Note: There were no days without H-alpha photographs.

H $\alpha$  SYNOPTIC CHART  
1973 - Rotation 1601

*Long.	*Lat.	Date	Descriptive Notes
332	S12	5/3	Birth of strong active region in following portion of larger region with declining class E spot group. New spots reached maximum by 6 May as class D group and blended with older group to give appearance of a class F spot region. All spots had nearly disappeared before west limb passage.
305	S33	5/8	Filament disappeared.
300	S15	5/3	Probable date of birth of small active region on east limb.
290	S29	5/10	Filament disappeared.
263	N05	5/11	Birth of small region.
198	S08	5/14	Birth of small region that reached maximum as a C-type spot group 16 May.
180	N58	5/21	Filament disappeared.
151	N11	5/19	Major region, with polarities reversed from normal arrangement for Northern Hemisphere, was at maximum spot area as complex class D group.
109	S12	5/23	Birth of small region.
100	S03	5/24	Birth of active region on boundary of faint extensive plage. Reached maximum activity as D-type spot group next day. This was fourth consecutive disk passage for activity at this location.
69	N18	5/27	Birth of small region that reached peak activity as C-type spot group on 29 May.
43	N15	5/27	Small bright region appeared in old plage 1 day only.

Note: There were no days without H-alpha photographs.

# H $\alpha$ SYNOPTIC CHART 1973- ROTATION 1601

H $\alpha$  SYNOPTIC CHART  
1973 - Rotation 1602

*Long.	*Lat.	Date	Descriptive Notes
355	N12	6/2	Filament disappeared.
352	S03	6/2	Filament disappeared.
340	N07	6/2	Filament disappeared.
300	N12	6/7	Birth of small region. Reached maximum as B-type spot group on date of birth, then dissipated rapidly.
280	N05	6/6	Birth of small region.
265	N15	6/5 6/11 6/14	Birth of small region. Beginning of rapid growth. Probable maximum development at west limb as a D-type spot group.
210	N15	6/9	Significant plage brightening was followed by rapid decay and spreading of this region. Had D-type spot group from 7-11 June. Region rotated onto disk 6 June.
		6/15	Large flare occurred on day spot group diminished to single spot without penumbra. Flare was extensively recorded by Skylab ATM telescopes.
196	N12	6/10	Birth of small short-lived region.
160	N10	6/13	Disappearance of very large filament in apparent response to developing active region east of this location.
154	N15	6/13	Peak development of reversed polarity, class D spot group at identical site of the great reversed-polarity region of the previous two solar rotations. Source of numerous strong flares observed with Skylab ATM telescopes.
145	N17	6/14	Birth of active region near following border of active, reversed-polarity region. Blended with older region by 17 June.
132	N08	6/16	Large filaments disappeared. Re-formed next day and became especially large by west limb on 24 June.
63	S09	6/18	Birth of region near east limb. Reached maximum as a D-type spot group 19 June. Very similar to region that followed closely near same latitude. These two regions lay within the large-scale area known as "the fish"--an area on its fifth disk transit as a recognizable feature.
50	S04	6/25	Central meridian date of region that rotated onto disk 18 June and reached maximum as a D-type spot group 20 June.
30	S20	6/28	Birth of small region on leading edge of old plage.

Note: There were no days without H-alpha photographs.

330	S28	10/19	Filament disappeared.
288	N10	10/21	Filament disappeared.
255	M15	10/25	Spots became visible in H-alpha in old plage area that rotated onto the disk on 18 October. The C-type spot group was diminished by 26 October.
224	S27	10/27	Filament disappeared.
200	N30	10/24	Filaments in this area formed a large, closed cell, then opened and stretched to western filaments on 28 October. Cell moved eastward to combine with large-scale area of negative polarity by next rotation.
199	S13	10/21	East limb passage of large region that formed where significant region was present since rotation 1604. Reached peak activity 22 October as a D-type spot group. Region decayed slowly throughout disk passage. Associated filaments were active.
196	S09	10/31	Filament within faint plage east of large class D spot group disappeared.
190	S25	10/30	Filament disappeared.
167	N12	10/30	OMP of single class H sunspot with little accompanying plage. This was third disk passage of leader spot that was associated with important flare-surge activity during September. Note its nearly stationary position while surrounding large-scale neutral lines were in motion relative to Carrington coordinates.
165	N29	10/31	Filament disappeared after slow fade from 29 October.
160	N28	10/29	Filament disappeared.
155	M15	11/2	Filament disappeared.
115	M05	10/28 11/2	Probable date of birth of small region at east limb. Filament disappeared from within faint plage.
49	S32	11/4	Filament disappeared.

Note: There were no days without H-alpha photographs.

# H $\alpha$ SYNOPTIC CHART

1973-ROTATION 1607

H $\alpha$  SYNOPTIC CHART  
1973 - Rotation 1608

°Long.	°Lat.	Date	Descriptive Notes	°Long.	°Lat.	Date	Descriptive Notes
358	N05	11/12	Birth of small region, which decayed before completing disk passage.	50	N05	12/4	Filament disappeared.
320	N15	11/14	Large filament disappeared. Underlying neutral line had become convoluted since previous rotation, indicating change in neighboring large-scale velocity pattern.	45	N12	11/30	Birth of small region.
265	N13	11/12	Probable date of birth of region on east limb that developed into a large class C spot group by 14 November.	5	N10	12/4	Birth of small region.
258	N13	11/19	Birth of small region near follower portion of older plage.	0	N40	12/9	Filament disappeared.
243	S11	11/24	Birth of small active region.				
233	S08	11/21	Birth of active region that reached maximum as class D spot group on 23 November.				
208	S08	11/22	Filament disappeared near time of birth of region west of this location.				
205	S10	11/25	Birth of small region in old plage area. Region decayed rapidly.				
195	S18	11/21	Filament disappeared.				
187	N09	11/24	Birth of small region that remained bright and stable throughout disk passage.				
180	S13	11/18	Birth of small region that decayed rapidly.				
	N09	11/29	Large filament in this region disappeared.				
			Birth of active region within area of faint plage.				
170	N32	11/26	CMP of exceptionally large filament in configuration of "seagull" and known as Jonathan Livingston Sea-gull by Skylab crew and ground support teams. Formed northern boundary of a large-scale feature that arose from the merger of two cellular areas of previous solar rotations.				
152	S11	11/21	East limb passage of large and complex region that reached maximum as class E spot group on 25 November.				
150	S15	11/28	Birth of small region that merged with large region north of this location.				
133	S17	11/29	Filament disappeared.				
115	S19	12/3	Filament disappeared.				
71	N47	12/6	Filament disappeared.				
65	N18	12/6	Filament disappeared.				

Note: There were no days without H-alpha photographs.

# H<sub>a</sub> SYNOPTIC CHART 1973 - ROTATION 1608

H $\alpha$  SYNOPSIS CHART  
1973-1974 - Rotation 1609

°Long.	°Lat.	Date	Descriptive Notes
346	S20	12/12	Birth of small active region.
315	N15	12/13-15	Gradual and partial disappearance of filament above neutral line that had become progressively more convoluted over the previous two solar rotations.
		12/21	The deformation of this large-scale and long-lived structure assumed special significance with the occurrence of a great coronal transient at west limb, above this location.
305	N03	12/13-14	CMP of small region that was decaying slowly through-out disk transit. Notable for its highly convoluted neutral line and its location near a large-scale neutral line that had become progressively convoluted during the previous two solar rotations. This region may have been involved in the great west limb transient of 21 December.
290	S10	12/11-14	Gradual disappearance of filament.
240	S32	12/19	Filament disappeared; associated with faint plage north of this location.
211	S13	12/19 12/23	Birth of active region with slow initial development. Rapid growth with maximum development 25 December as class D spot group.
208	S10	12/19	Birth of small active region. It later merged with larger region that formed southwest of this location.
190	S18	12/16	Probable date of birth of large active region that grew to class E spot group by 20 December. Leader spot continued to enlarge after maximum plage development.
189	S08	12/25	Birth of small region within extensive faint plage.
187	N18	12/23	Filament disappeared.
145	N06	12/24	Partial disappearance of filament; re-formed and became especially large before west limb transit.
105	N26	12/31	Filament disappeared.
50	M13	1/1	Birth of tiny active region that was gone by 4 January.
42	S17	1/1	Birth of small region that reached small class D spot group by next day.
40	N45	12/30	Filaments disappeared near east limb.
25	S41	12/31	Filament disappeared.

Note: There were no days without H-alpha photographs.

# H $\alpha$ SYNOPTIC CHART 1974 - Rotation 1610

$^{\circ}$ Long.	$^{\circ}$ Lat.	Date	Descriptive Notes
340	S22	1/5-6	Filament disappeared.
308	N09	1/7	Birth of region that grew to maximum by 10 January with type D group. An associated dark filament developed on the southern boundary of plage on 9 January.
261*	N08	1/9	Birth of small region that disappeared by 13 January but again brightened on 15 January.
252*	N10	1/9	Birth of small region that disappeared 18 January.
243	S10	1/15-18	Filament developed within and south of this moderate active region.
240	N29	1/14-15	Filament disappeared.
226	N19	1/16	Birth of small region.
188	N07	1/18	Birth of region that commenced rapid growth 20 January and continued bright until west limb passage on 23 January.
185	S18	1/22	Minor growth within extensive area of weak plage.
183	N30	1/21	Disappearance of large filament.
180	Equator -S10	1/18	Filament crossing the equator disappeared with chromospheric brightening.
177	N15	1/19	Birth of small region.
173	S14	1/13	Birth of region at, or just before, east limb passage. Developed to maturity by 17 January and interacted with extensive surrounding remnant plage and filaments. Decay nearly completed by west limb passage on 25 January.
140	N16	1/27	Filament disappeared.
137	N17	1/28	Birth of small region near site of filament that disappeared during previous 24 hours.
90	S17	1/26	Birth of very small region.
62	N17	1/30	Birth of small region with additional growth on 1 February.
52	N01	1/30	Birth of small region.

Note: There were no days without H-alpha photographs. Chart in error by 10° for these regions.

# H $\alpha$ SYNOPTIC CHART 1974 - ROTATION 1610

# H $\alpha$ SYNOPTIC CHART 1974 - Rotation 1611

$^{\circ}$ Long.	$^{\circ}$ Lat.	Date	Descriptive Notes
250	N29	2/7-10	Filament gradually disappeared.
230	S30	2/15	Birth and rapid growth of bright, spotted, active region in midst of extensive faint plage. Plage had faded by next day and continued to fade at west limb on 17 February.
214	N10	2/7	Birth of region near east limb. Faded significantly by 12 February.
200	S15	2/7	Probable date of birth of moderate active region at east limb.
		2/10-13	Filaments south of active region varied in position and intensity.
		2/17	Significant new growth of region.
190	S18	2/21	Birth of moderate active region on boundary of existing region. Growth maximized on 23 February with type D group.
150	S20	2/15	Birth of moderate active center 10 $^{\circ}$ west of older, small, spotted region. Growth to large type D spots by 18 February.
		2/21-22	Active dark filaments encircled leader sunspot.
135	S40	2/20	Filament disappeared.
3	N10 S17	2/26 3/2	Birth of small region. Birth of very small region that disappeared next day.

Note: There were no days without H-alpha photographs.

# H $\alpha$ SYNOPTIC CHART 1974 - ROTATION 1611

H $\alpha$  SYNOPTIC CHART  
1974 - Rotation 1612

$^{\circ}$ Long.	$^{\circ}$ Lat.	Date	Descriptive Notes
344	N12	2/27	Small filament disappeared.
318	S02	3/3-4	Rapid disappearance of plage.
315	S45	3/2	Filament disappeared.
297	S16	3/2	Filament disappeared.
255	N10	3/8	Active filament formed southeast of leading portion of small plage, outlining a portion of neutral line encircling the leader plage. Filament formed progressively along neutral line to the west by 10 March. All filament material disappeared by 11 March and associated plage faded rapidly thereafter. This filament and plage evolution occurred simultaneously with the birth and rapid growth of a moderate active region southeast of this location.
243	N01	3/9	Birth of moderate active region that developed stronger leader spot by 12 March. Growth of region was accompanied by filament developments to the southeast, west and northwest. Filaments encircled leader portion of region on 13 March.
235	S20-40	3/7-11	Filament very active.
233	N02	3/7	Filament disappeared.
225	S14	3/12	Filament disappeared.
223	S02	3/12	Filament disappeared.
188	N13	3/18	Filament disappeared.
160	S25	3/14	Filament section ejected vertically and westward from neutral line. The filament showed in projection against the disk southwest of the neutral line. Polar-crown filament became complete over a 60 $^{\circ}$ length of neutral line.
113	N17	3/22	Birth of moderate active region that reached maximum intensity same day.
		3/25	Minor new growth just before west limb passage.
40	N07	3/27	Birth of moderate active region that reached maximum size by 29 March, two days before west limb passage.

Note: There were no days without H-alpha photographs.

# H<sub>α</sub> SYNOPSIS CHART

1974 - ROTATION 1612

H<sub>q</sub> SYNOPSIS CHART  
1974 - Rotation 1613

*Long.	*Lat.	Date	Descriptive Notes	*Long.	*Lat.	Date	Descriptive Notes
327	N15	3/28	Small filament disappeared.	103	N02	4/18	Birth of small active region with slow growth through 21 April.
288	S10	3/30	Birth of small active region that reached maximum development by 1 April. Follower-polarity portion of region partially encircled with a filament.	100	S10	4/19	Disappearance of filament during time of rapid growth of three active regions near its western terminus.
280	S10	4/5	Circular filament around follower portion of active region disappeared.	52	S14	4/18	Small filament disappeared.
260	M13	3/31	Birth of active region near east limb. Growth very slow until 4 April; reached maximum on 6 April with small type D spot group.	40	S35	4/26	Filament disappeared.
237	N05	4/7	Filament disappeared.				
227	S17	4/4	Filament disappeared.				
214	S04	4/7	Birth of small active region that grew slowly until 11 April, when more rapid development began that peaked by 13 April. Spot group attained only class B size.				
196	M12	4/15	Birth of small active region.				
185	S12	4/7	Birth of major active center on filament-outlined neutral line. Growth continued during the entire disk passage. Important increase in growth occurred on 13 April: an additional strong spot group emerged, centered on the same neutral line at S08. The first spot group attained a class F size; the second a class E.				
	M15	4/15	Birth of small active region.				
183	N08	4/15	Birth of small active region.				
165	S15	4/8	Birth of small active region that grew slowly until 14 April; thereafter growth accelerated. Attained maximum size as class D spot group by 16 April, 2 days before west limb passage.				
150	S20-40	4/15	C-shape filament and filament to the south simultaneously disappeared during maximum growth of the two active regions sharing their underlying neutral lines.				
124	S13	4/15	Birth of active region that began rapid growth 18 April. Attained class E spot group with slow growth continuing by west limb passage on 21 April. Simultaneous growth of two smaller active regions and filament activity, both to the northeast, may be related to the (124,S13) region development.				
119	S09	4/16	Birth of small active region that attained class D spot group by 19 April.				
105	M18	4/16-17	Gradual disappearance of filament.				

Note: There were no days without H-alpha photographs.

Last Revision 3/31/77 SLO

# H $\alpha$ SYNOPSIS CHART 1974 - Rotation 1614

*Long.	*Lat.	Date	Descriptive Notes	*Long.	*Lat.	Date	Descriptive Note
350	S08	4/21	Birth of small active region that grew slowly to class C spot group by 25 April.	140	S27	5/9	Half of semicircular filament disappeared.
322	N19	4/29	Birth of small active region.	135	N12	5/16	Large semicircular filament disappeared.
303	N08	5/1	Birth of active region that grew to maximum next day as small class C spot group.	130	N37	5/9	Formation of small filament.
273	N05	5/2	Birth of active region that reached maximum intensity by 4 May.	112	N05	5/12	Minor new growth of plage and small spots within old plage.
		5/6	Additional growth at west limb simultaneous with emergence of new region at (269,N21).	105	N11	5/16	Disappearance of filament and beginning of rapid decay of associated active region.
	N12	5/6	Formation of filament between two growing active regions.	98	N44	5/12	Formation of filament.
269	N21	5/5	Birth of small active region that reached peak next day, just before west limb passage.	45	S35	5/20	Disappearance of filament while neutral line to the west developed more filament material.
262	N45	5/3	Disappearance of filament.	25	S57	5/17	Filament clearly visible this day only. Indicated continuance of weak positive-polarity area mapped on previous solar rotation. Evidence for positive-polarity area from Mt. Wilson magnetogram only. Existence suggested by continuity with earlier solar rotations.
260	N10	4/26	East limb passage of faint spotless plage with simple neutral line.	10	S18	5/22	Birth of small active region with tiny spots.
243	S08	5/7	Birth of small active region.	5	N16	5/26	Birth of small active region with single tiny sunspot.
222	S03	5/4	Birth of new small region within follower magnetic fields of old region and near the neutral line adjacent to large old leader spot. New region reached maximum development within small leader spot visible on 7 May. Neutral line in old region rearranged to run continuously through both new and old regions.				
209	S06	5/6	Formation of bright plage with many small spots on the northern border of leader spot. This activity began to decay by 8 May.				
202	S05	5/1-4	Rapid disappearance of follower plage and associated peninsular neutral line, as the large-scale neutral line through the giant active region to the east took on the simple form observed on rotation 1615. This major simplification may be associated with the great limb events of 30 April (Wu et al. 1975, <i>Solar Wind</i> , 44, 117).				
183	N13	5/4	Small filament disappeared as a large portion of neutral line from here south moved rapidly west. Early position is marked as a crossed line.				
180	N21	5/2-14	Large filament active throughout disk transit. Partially disappeared 12 May.				
175	S15	5/7	Plage near old isolated sunspot began to intensify slowly over the next few days, as if the follower magnetic fields of the large region to the west began to interact with this region. Intensification continued until west limb passage on 14 May.				
173	S04	5/10	Part of circular filament disappeared.				
170	S08	5/11	Remainder of circular filament disappeared.				
155	N12	5/8	Birth of tiny bipolar plage.				
		5/11	Additional tiny plage with sunspot formed west of older tiny plage.				

Note: There were no days without H-alpha photographs.

1974 - Rotation 1615

"Long.	"Lat.	Date	Descriptive Notes	"Long.	"Lat.	Date	Descriptive Notes
355	S18	5/18-22	Filament gradually disappeared. Active regions formed east and west of this location during the next 4 days.	120	N10	6/11	Filament formed north of active region and enlarged 13 June.
354	N12	5/22	Birth of tiny bipolar region that virtually disappeared by 25 May. A larger new region formed immediately west of this location on 26 May. Very faint even by next day at west limb.	116	S04	6/8	Filament formed along same neutral line and north of disappearing filament at (100, S12). Filament disappeared.
345	S15	5/22	Appearance of area of scattered faint plage in trailing portion of still fainter plage. Faded by next day.	100	S12	6/10	Filament became fully developed. Filament disappeared.
317	N05	5/24	Birth of moderate active region that grew rapidly to maximum as a type D spot group by 28 May. Slight decay at west limb passage on 29 May.	62	S18	6/7	Birth of small active region.
285	N18	5/30	Filament formed within faint plage.	60	N06	6/8	Appearance at east limb of moderate active region that was growing. Attained maximum as a type E spot group with a high spot count by 12 June.
230-320	N30-50	5/28	Filament disappeared.	55	N14	6/14	Filament on northern boundary of large active region disappeared. It had been active for previous 7 days (from east limb to central meridian). Reappeared next day, but disappeared again 16 June and only partially re-formed during remainder of disk passage.
195	N18	5/29-6/8	Tiny region visible this day only.				
188	S19	6/4	Filament disappeared.				
183	S07	6/6	Large filament active during this period.				
172	S16	6/3	Filament re-formed 6 June at an abnormal distance above the neutral line, forming closely-spaced parallel filaments. The upper filament became dark and wide on 7 June and disappeared the next day.				
165	S06	6/9	Filament well-developed this day only.				
156	N16	6/6	Filament disappeared on western boundary of small cell encircling leader sunspot.				
148	S12	6/5	Birth of bright active region with numerous small sunspots.				
145	S19	6/6	Additional growth near west limb.				
126	N06	6/4	Filament disappeared.				
			Birth of small region that became faint and scattered by next day.				
			Additional plage growth.				
			Semicircular filament disappeared				
			Birth of moderate active region near east limb. Attained maximum by 6 June as class D spot group and dissipate thereafter.				

Note: Day without H- $\alpha$  photographs was 31 May 1974.

1974 - ROTATION 1615

# H<sub>α</sub> SYNOPSIS CHART 1974 - Rotation 1616

°Long.	°Lat.	Date	Descriptive Notes	°Long.	°Lat.	Date	Descriptive Notes
350	S12	6/13-24	Returning active region with large type H sunspot and two umbrae within symmetric penumbra. Spot elongated, umbrae separated and area steadily diminished throughout the disk passage. Spots disappeared entirely by 24 June, just before west limb passage. Active filament partially encircling sunspot disappeared.	152	S16	7/3	narrow corridor in which all the powerful flares commenced, including white-light emission during at least two of the greatest flares. X-ray flux saturated satellite sensors on 4 and 5 July. Proton event and magnetic storm followed.
		6/17	Active filament partially encircling sunspot disappeared.				Rearrangement of neutral lines as developing region to the west led to fission of positive-polarity area.
		6/18	Filament re-formed north of sunspot in elevated and active form.	128	S13	7/4	Birth of moderate active center that attained maximum as small class C spot group on 6 July.
		6/20	Filament north of sunspot and filament south of plage both disappeared, leaving only the filament within the plage.			7/9	Filament encircled leader polarity on this day.
		6/21	Filament south of plage re-formed in elevated and active form.	110-140	N14-S05	7/5	Filaments bordering large-scale positive-polarity cell on equator disappeared on same day.
		6/22	Filament south of plage disappeared again.	60	S30	7/8	Filament disappeared.
		6/23	Filament re-formed both north and south of region and remained until west limb passage on 25 June.	43	S02	7/9	Birth of very small active region.
290	N11	6/18-29	Small decaying active region moved westward by 5 heliographic degrees during the disk passage at an abnormally fast rate. Neutral line became more nearly parallel to solar equator during this time, as if the follower polarity plage rotated faster than the leader polarity. Region axis inclination also unusual because follower polarity portion lay at lower latitude than leader.	10	S08	7/8-20	Large active region with large symmetric leader sunspot. Isolated pole on southwest border of spot source of frequent dark surges. Neutral line approached spot on border opposite to the surging. Spot umbra divided and rotated slightly during disk passage.
			Filament large and active.				Curved filament formed.
270	N35	6/24-28	Filament large and active.	4	S20	7/13	Filament disappeared.
205	S10	6/30	Birth of moderate active center on neutral line that had been a major feature in the large-scale magnetic patterns for several previous solar rotations. Attained maximum as type D sunspot group on 3 July.			7/15	
195	S11	6/27	Filament disappeared over sharp inflection of neutral line.				
185	S20	6/29	Section of filament lifted, projecting the filament to a position north of the surface neutral line. This location produced identical unusual filament behavior on previous disk passage.				
175	S10	6/29-7/3	Decay accelerated in faint active region with single leader spot as rapid growth occurred in great active center <10° east of it.				
		7/4	Minor new growth of plage and small spots.				
		7/6	Peak plage and spot development.				
170	S17	7/1	Neutral line rearranged as positive-polarity areas merged with expansion of growing active center to the east.				
157	S13	6/28	Birth of one of the most powerful active centers of Solar Cycle 20.				
		6/29	Rapid growth to type E sunspot group as two bipolar plage and spot areas merged. Point of merger developed powerful "delta" magnetic configuration with some of the strongest field strengths and steepest field gradients ever recorded. Space between the opposite polarity spots was marked by a brilliant				

Note: There were no days without H-alpha photographs.

# UAG Series of Reports

UAG Reports are issued on an irregular basis, with 6 to 12 reports being issued each year. Subscriptions may be ordered through the National Geophysical and Solar-Terrestrial Data Center, Environmental Data and Information Service, NOAA, Boulder, CO 80303, USA. The annual subscription price is \$25.20 (\$17.30 additional for foreign mailing). In years when the single price copies are less than \$25.20, arrangements will be made to extend the subscription duration. Single issues are also available at the prices shown below. Some of the issues are now out of print and are available only on microfiche. Orders must include check or money order payable in U.S. currency to the Department of Commerce, NOAA/NGSDC.

- UAG-1 "IQSY Night Airglow Data", price \$1.75.
- UAG-2 "A Reevaluation of Solar Flares, 1964-1966", price 30 cents.
- UAG-3 "Observations of Jupiter's Sporadic Radio Emission in the Range 7.6-41 MHz, 6 July 1966 through 8 September 1968", microfiche only, price 45 cents.
- UAG-4 "Abbreviated Calendar Record 1966-1967", price \$1.25.
- UAG-5 "Data on Solar Event of May 23, 1967 and its Geophysical Effects", price 65 cents.
- UAG-6 "International Geophysical Calendars 1957-1969", price 30 cents.
- UAG-7 "Observations of the Solar Electron Corona: February 1964-January 1968", price 15 cents.
- UAG-8 "Data on Solar-Geophysical Activity October 24-November 6, 1968", price (includes Parts 1 & 2) \$1.75.
- UAG-9 "Data on Cosmic Ray Event of November 18, 1968 and Associated Phenomena", price 55 cents.
- UAG-10 "Atlas of Ionograms", price \$1.50.
- UAG-11 "Catalogue of Data on Solar-Terrestrial Physics" (now obsolete).
- UAG-12 "Solar-Geophysical Activity Associated with the Major Geomagnetic Storm of March 8, 1970", price (includes Parts 1-3) \$3.00.
- UAG-13 "Data on the Solar Proton Event of November 2, 1969 through the Geomagnetic Storm of November 8-10, 1969, price 50 cents.
- UAG-14 "An Experimental, Comprehensive Flare Index and Its Derivation for 'Major' Flares, 1955-1969", price 30 cents.
- UAG-15 "Catalogue of Data on Solar-Terrestrial Physics" (now obsolete).
- UAG-16 "Temporal Development of the Geographical Distribution of Auroral Absorption for 30 Substorm Events in each of IQSY (1964-65) and IASY (1969)", price 70 cents.
- UAG-17 "Ionospheric Drift Velocity Measurements at Jicamarca, Peru (July 1967-March 1970)", microfiche only, price 45 cents.
- UAG-18 "A Study of Polar Cap and Auroral Zone Magnetic Variations", price 20 cents.
- UAG-19 "Reevaluation of Solar Flares 1967", price 15 cents.
- UAG-20 "Catalogue of Data on Solar-Terrestrial Physics" (now obsolete).
- UAG-21 "Preliminary Compilation of Data for Retrospective World Interval July 26 - August 14, 1972", price 70 cents.
- UAG-22 "Auroral Electrojet Magnetic Activity Indices (AE) for 1970", price 75 cents.
- UAG-23 "U.R.S.I. Handbook of Ionogram Interpretation and Reduction, Second Edition, November 1972", edited by W. R. Piggott and K. Rawer, NGSDC/EDS/NOAA, November 1972, 324 pages, price \$1.75.
- UAG-23A "U.R.S.I. Handbook of Ionogram Interpretation and Reduction, Second Edition, November 1972", Revision of Chapters 1-4, edited by W. R. Piggott and K. Rawer, NGSDC/EDS/NOAA, July 1978, 135 pages, price \$2.14.
- UAG-24 "Data on Solar-Geophysical Activity Associated with the Major Ground Level Cosmic Ray Events of 24 January and 1 September 1971", price (includes Parts 1 and 2) \$2.00.
- UAG-25 "Observations of Jupiter's Sporadic Radio Emission in the Range 7.6-41 MHz, 9 September 1968 through 9 December 1971", price 35 cents.
- UAG-26 "Data Compilation for the Magnetospherically Quiet Periods February 19-23 and November 29 - December 3, 1970", price 70 cents.
- UAG-27 "High Speed Streams in the Solar Wind", price 15 cents.
- UAG-28 "Collected Data Reports on August 1972 Solar-Terrestrial Events", price (includes Parts 1-3) \$4.50.
- UAG-29 "Auroral Electrojet Magnetic Activity Indices AE (11) for 1968", price 75 cents.
- UAG-30 "Catalogue of Data on Solar-Terrestrial Physics", price \$1.75.
- UAG-31 "Auroral Electrojet Magnetic Activity Indices AE (11) for 1969", price 75 cents.
- UAG-32 "Synoptic Radio Maps of the Sun at 3.3 mm for the Years 1967-1969", price 35 cents.
- UAG-33 "Auroral Electrojet Magnetic Activity Indices AE (10) for 1967", price 75 cents.
- UAG-34 "Absorption Data for the IGY/IGC and IQSY", price \$2.00.
- UAG-35 "Catalogue of Digital Geomagnetic Variation Data at World Data Center A for Solar-Terrestrial Physics", price 20 cents.
- UAG-36 "An Atlas of Extreme Ultraviolet Flashes of Solar Flares Observed Via Sudden Frequency Deviations During the ATM-SKYLAB Missions", price 55 cents.
- UAG-37 "Auroral Electrojet Magnetic Activity Indices AE (10) for 1966", price 75 cents.
- UAG-38 "Master Station List for Solar-Terrestrial Physics Data at WDC-A for Solar-Terrestrial Physics", price \$1.60.
- UAG-39 "Auroral Electrojet Magnetic Activity Indices AE (11) for 1971", by Joe Haskell Allen, Carl C. Abston and Leslie D. Morris, National Geophysical and Solar-Terrestrial Data Center, Environmental Data Service, February 1975, 144 pages, price \$2.05.
- UAG-40 "H-Alpha Synoptic Charts of Solar Activity For the Period of Skylab Observations, May, 1973-March, 1974", by Patrick S. McIntosh, NOAA Environmental Research Laboratories, February 1975, 32 pages, price 56 cents.
- UAG-41 "H-Alpha Synoptic Charts of Solar Activity During the First Year of Solar Cycle 20, October, 1964 - August, 1965", by Patrick S. McIntosh, NOAA Environmental Research Laboratories, and Jerome T. Nolte, American Science and Engineering, Cambridge, Massachusetts, March 1975, 25 pages, price 48 cents.
- UAG-42 "Observations of Jupiter's Sporadic Radio Emission in the Range 7.6-80 MHz 10 December 1971 through 21 March 1975", by James W. Warwick, George A. Dulk, and Anthony C. Riddle, Department of Astro-Geophysics, University of Colorado, Boulder, Colorado 80302, April 1975, 49 pages, price \$1.15.
- UAG-43 "Catalog of Observation Times of Ground-Based Skylab-Coordinated Solar Observing Programs", compiled by Helen E. Coffey, World Data Center A for Solar-Terrestrial Physics, May 1975, 159 pages, price \$3.00.
- UAG-44 "Synoptic Maps of Solar 9.1 cm Microwave Emission from June 1962 to August 1973", by Werner Graf and Ronald N. Bracewell, Radio Astronomy Institute, Stanford University, Stanford, California 94305, May 1975, 183 pages, price \$2.55.

- UAG-45 "Auroral Electrojet Magnetic Activity Indices AE (11) for 1972", by Joe Haskell Allen, Carl C. Abston and Leslie D. Morris, National Geophysical and Solar-Terrestrial Data Center, Environmental Data Service, May 1975, 144 pages, price \$2.10.
- UAG-46 "Interplanetary Magnetic Field Data 1963-1974", by Joseph H. King, National Space Science Data Center, NASA Goddard Space Flight Center, Greenbelt, Maryland 20771, June 1975, 382 pages, price \$2.95.
- UAG-47 "Auroral Electrojet Magnetic Activity Indices AE (11) for 1973", by Joe Haskell Allen, Carl C. Abston and Leslie D. Morris, National Geophysical and Solar-Terrestrial Data Center, Environmental Data Service, June 1975, 144 pages, price \$2.10.
- UAG-48A "Synoptic Observations of the Solar Corona during Carrington Rotations 1580-1596 (11 October 1971 - 15 January 1973)", [Reissue with quality images] by R. A. Howard, M. J. Koomen, D. J. Michels, R. Tousey, C. R. Detwiler, D. E. Roberts, R. T. Seal and J. D. Whitney, E. O. Hulbert Center for Space Research, NRL, Washington, D. C. 20375 and R. T. and S. F. Hansen, C. J. Garcia and E. Yasukawa, High Altitude Observatory, NCAR, Boulder, Colorado 80303, February 1976, 200 pages, price \$4.27.
- UAG-49 "Catalog of Standard Geomagnetic Variation Data", prepared by Environmental Data Service, NOAA, Boulder, Colorado, August 1975, 125 pages, price \$1.95.
- UAG-50 "High-Latitude Supplement to the URSI Handbook on Ionogram Interpretation and Reduction", by W. R. Piggott, British Antarctic Survey, c/o SRC, Appleton Laboratory, Ditton Park, Slough, England, October 1975, 292 pages, price \$4.00.
- UAG-51 "Synoptic Maps of Solar Coronal Hole Boundaries Derived from He II 304A Spectroheliograms from the Manned Skylab Missions", by J. D. Bohlín and D. M. Rubenstein, E. O. Hulbert Center for Space Research, Naval Research Laboratory, Washington, D. C. 20375 U.S.A., November 1975, 30 pages, price 54 cents.
- UAG-52 "Experimental Comprehensive Solar Flare Indices for Certain Flares, 1970-1974", compiled by Helen W. Dodson and E. Ruth Hedeman, McMath-Hulbert Observatory, The University of Michigan, 895 Lake Angelus Road North, Pontiac, Michigan 48055 U.S.A., November 1975, 27 pages, price 60 cents.
- UAG-53 "Description and Catalog of Ionospheric F-Region Data, Jicamarca Radar Observatory (November 1966 - April 1969)", by W. L. Clark and T. E. Van Zandt, Aeronomy Laboratory, NOAA, Boulder, Colorado 80302 and J. P. McClure, University of Texas at Dallas, Dallas, Texas 75230, April 1976, 10 pages, price 33 cents.
- UAG-54 "Catalog of Ionosphere Vertical Soundings Data", prepared by Environmental Data Service, NOAA, Boulder, Colorado 80302, April 1976, 130 pages, price \$2.10.
- UAG-55 "Equivalent Ionospheric Current Representations by a New Method, Illustrated for 8-9 November 1969 Magnetic Disturbances", by Y. Kamide, Cooperative Institute for Research in Environmental Sciences, University of Colorado, Boulder, Colorado 80302 and Geophysical Institute, University of Alaska, Fairbanks, Alaska 99701, H. W. Kroehl, Data Studies Division, NOAA/EDS/NGSDC, Boulder, Colorado 80302, M. Kanamitsu, Advanced Study Program, National Center for Atmospheric Research, Boulder, Colorado 80303, J. H. Allen, Data Studies Division, NOAA/EDS/NGSDC, Boulder, Colorado 80302, and S.-I. Akasofu, Geophysical Institute, University of Alaska, Fairbanks, Alaska 99701, April 1976, 91 pages, price \$1.60.
- UAG-56 "Iso-intensity Contours of Ground Magnetic H Perturbations for the December 16-18, 1971 Geomagnetic Storm", by Y. Kamide, Cooperative Institute for Research in Environmental Sciences, University of Colorado, Boulder, Colorado 80302 and Geophysical Institute, University of Alaska, Fairbanks, Alaska 99701 (currently Guest worker at Data Studies Division, NOAA/EDS/NGSDC, Boulder, Colorado 80302), April 1976, 37 pages, price \$1.39.
- UAG-57 "Manual on Ionospheric Absorption Measurements", edited by K. Rawer, Institut für Physikalische Weltraumforschung, Freiburg, G.F.R., June 1976, 202 pages, price \$4.27.
- UAG-58 "ATS6 Radio Beacon Electron Content Measurements at Boulder, July 1974 - May 1975", by R. B. Fritz, Space Environment Laboratory (currently with Wave Propagation Laboratory), NOAA, Boulder, Colorado 80302 USA, September 1976, 61 pages, price \$1.04.
- UAG-59 "Auroral Electrojet Magnetic Activity Indices AE(11) for 1974", by Joe Haskell Allen, Carl C. Abston and Leslie D. Morris, National Geophysical and Solar-Terrestrial Data Center, Environmental Data Service, December 1976, 144 pages, price \$2.16.
- UAG-60 "Geomagnetic Data for January 1976 (AE(7) Indices and Stacked Magnetograms)" by J. H. Allen, C. C. Abston and L. D. Morris, NGSDC/EDS/NOAA, July 1977, 57 pages, price \$1.07.
- UAG-61 "Collected Data Reports for STIP Interval II 20 March - 5 May 1976", edited by Helen E. Coffey and John A. McKinnon, National Geophysical and Solar-Terrestrial Data Center, Environmental Data Service, August 1977, 313 pages, price \$2.95.
- UAG-62 "Geomagnetic Data For February 1976 (AE(7) Indices and Stacked Magnetograms)" by J. H. Allen, C. C. Abston and L. D. Morris, NGSDC/EDS/NOAA, September 1977, 55 pages, price \$1.11.
- UAG-63 "Geomagnetic Data for March 1976 (AE(7) Indices and Stacked Magnetograms)" by J. H. Allen, C. C. Abston and L. D. Morris, NGSDC/EDS/NOAA, September 1977, 57 pages, price \$1.11.
- UAG-64 "Geomagnetic Data for April 1976 (AE(8) Indices and Stacked Magnetograms)" by J. H. Allen, C. C. Abston and L. D. Morris, NGSDC/EDS/NOAA, February 1978, 55 pages, price \$1.00.
- UAG-65 "The Information Explosion and Its Consequences for Data Acquisition, Documentation, and Processing" by G. K. Hartmann, Max-Planck-Institut für Aeronomie, D-3411 Katlenburg-Lindau 3, GFR, May 1978, 36 pages, price 75 cents.
- UAG-66 "Synoptic Radio Maps of the Sun at 3.3mm 1970-1973" by Earle B. Mayfield, Space Science Lab., and Fred I. Shimabukuro Electronics Res. Lab., The Ivan A. Gettling Laboratories, The Aerospace Corp., El Segundo, California 90245, May 1978, 30 pages, price 75 cents.
- UAG-67 "Ionospheric D-Region Profile Data Base, A Collection of Computer-Accessible Experimental Profiles of the D and Lower E Regions", by L. F. McNamara, Ionospheric Prediction Service, Sydney, Australia, August 1978, 30 pages, price 88 cents.
- UAG-68 "A Comparative Study of Methods of Electron Density Profile Analysis", by L. F. McNamara, Ionospheric Prediction Service, Sydney, Australia, September 1978, 56 pages, price \$1.41.
- UAG-69 "Selected Disturbed D-Region Electron Density Profiles. Their relation to the undisturbed D region", by L. F. McNamara, Ionospheric Prediction Service, Sydney, Australia, October 1978, 50 pages, price \$1.29.
